Troubleshooting

Paragraph ended before \UTFviii@three@octets was complete	5
No hyphenation patterns were preloaded for (babel) the language ‘LANG’ into the format	5
You are loading directly a language style	8
Unknown language ‘LANG’	8
Argument of \language@active@arg” has an extra }	12
Package fontspec Warning: ‘Language ‘LANG’ not available for font ‘FONT’ with script ‘SCRIPT’ ‘Default’ language used instead’	27
Package babel Info: The following fonts are not babel standard families	27

Part I

User guide

- This user guide focuses on internationalization and localization with \LaTeX . There are also some notes on its use with Plain \TeX .
- Changes and new features with relation to version 3.8 are highlighted with **New X.XX**, and there are some notes for the latest versions in the babel wiki. The most recent features could be still unstable. Please, report any issues you find in GitHub, which is better than just complaining on an e-mail list or a web forum.
- If you are interested in the \TeX multilingual support, please join the kadingira mail list. You can follow the development of babel in GitHub (which provides many sample files, too).
- See section 3.1 for contributing a language.
- The first sections describe the traditional way of loading a language (with ldf files). The alternative way based on ini files, which complements the previous one (it does *not* replace it), is described below.

1 The user interface

1.1 Monolingual documents

In most cases, a single language is required, and then all you need in \LaTeX is to load the package using its standard mechanism for this purpose, namely, passing that language as an optional argument. In addition, you may want to set the font and input encodings. Many languages are compatible with xetex and luatex. With them you can use babel to localize the documents. When these engines are used, the Latin script is covered by default in current \LaTeX (provided the document encoding is UTF-8), because the font loader is preloaded and the font is switched to lmrroman. Other scripts require loading fontspec. You may want to set the font attributes with fontspec, too.

EXAMPLE Here is a simple full example for “traditional” \TeX engines (see below for xetex and luatex). The packages fontenc and inputenc do not belong to babel, but they are included in the example because typically you will need them (however, the package inputenc may be omitted with $\LaTeX \geq 2018-04-01$ if the encoding is UTF-8):

PDFTEX

```
\documentclass{article}

\usepackage[T1]{fontenc}
% \usepackage[utf8]{inputenc} % Uncomment if LaTeX < 2018-04-01

\usepackage[french]{babel}

\begin{document}

Plus ça change, plus c'est la même chose!

\end{document}
```

EXAMPLE And now a simple monolingual document in Russian (text from the Wikipedia) with xetex or luatex. Note neither fontenc nor inputenc are necessary, but the document

should be encoded in UTF-8 and a so-called Unicode font must be loaded (in this example `\babelfont` is used, described below).

LUATEX/XETEX

```
\documentclass{article}

\usepackage[russian]{babel}

\babelfont{rm}{DejaVu Serif}

\begin{document}

Россия, находящаяся на пересечении множества культур, а также
с учётом многонационального характера её населения, — отличается
высокой степенью этнокультурного многообразия и способностью к
межкультурному диалогу.

\end{document}
```

TROUBLESHOOTING A common source of trouble is a wrong setting of the input encoding. Depending on the \LaTeX version you could get the following somewhat cryptic error:

```
! Paragraph ended before \UTFviii@three@octets was complete.
```

Or the more explanatory:

```
! Package inputenc Error: Invalid UTF-8 byte ...
```

Make sure you set the encoding actually used by your editor.

Another approach is making the language (french in the example) a global option in order to let other packages detect and use it:

```
\documentclass[french]{article}
\usepackage{babel}
\usepackage{varioref}
```

In this last example, the package `varioref` will also see the option and will be able to use it.

NOTE Because of the way `babel` has evolved, “language” can refer to (1) a set of hyphenation patterns as preloaded into the format, (2) a package option, (3) an `ldf` file, and (4) a name used in the document to select a language or dialect. So, a package option refers to a language in a generic way – sometimes it is the actual language name used to select it, sometimes it is a file name loading a language with a different name, sometimes it is a file name loading several languages. Please, read the documentation for specific languages for further info.

TROUBLESHOOTING The following warning is about hyphenation patterns, which are not under the direct control of `babel`:

```
Package babel Warning: No hyphenation patterns were preloaded for
(babel)                  the language `LANG' into the format.
(babel)                  Please, configure your TeX system to add them and
(babel)                  rebuild the format. Now I will use the patterns
(babel)                  preloaded for \language=0 instead on input line 57.
```

The document will be typeset, but very likely the text will not be correctly hyphenated. Some languages may be raising this warning wrongly (because they are not hyphenated); it is a bug to be fixed – just ignore it. See the manual of your distribution (MacTeX, MikTeX, TeXLive, etc.) for further info about how to configure it.

1.2 Multilingual documents

In multilingual documents, just use a list of the required languages as package or class options. The last language is considered the main one, activated by default. Sometimes, the main language changes the document layout (eg, spanish and french).

EXAMPLE In \LaTeX , the preamble of the document:

```
\documentclass{article}
\usepackage[dutch,english]{babel}
```

would tell \LaTeX that the document would be written in two languages, Dutch and English, and that English would be the first language in use, and the main one.

You can also set the main language explicitly, but it is discouraged except if there a real reason to do so:

```
\documentclass{article}
\usepackage[main=english,dutch]{babel}
```

Examples of cases where main is useful are the following.

NOTE Some classes load babel with a hardcoded language option. Sometimes, the main language could be overridden with something like that before `\documentclass`:

```
\PassOptionsToPackage{main=english}{babel}
```

WARNING Languages may be set as global and as package option at the same time, but in such a case you should set explicitly the main language with the package option main:

```
\documentclass[italian]{book}
\usepackage[ngerman,main=italian]{babel}
```

WARNING In the preamble the main language has *not* been selected, except hyphenation patterns and the name assigned to `\language` (in particular, shorthands, captions and date are not activated). If you need to define boxes and the like in the preamble, you might want to use some of the language selectors described below.

To switch the language there are two basic macros, described below in detail: `\selectlanguage` is used for blocks of text, while `\foreignlanguage` is for chunks of text inside paragraphs.

EXAMPLE A full bilingual document follows. The main language is french, which is activated when the document begins. The package inputenc may be omitted with \LaTeX \geq 2018-04-01 if the encoding is UTF-8.

PDFTEX

```
\documentclass{article}

\usepackage[T1]{fontenc}
\usepackage[utf8]{inputenc}

\usepackage[english,french]{babel}

\begin{document}

Plus ça change, plus c'est la même chose!

\selectlanguage{english}

And an English paragraph, with a short text in
\foreignlanguage{french}{français}.

\end{document}
```

EXAMPLE With xetex and luatex, the following bilingual, single script document in UTF-8 encoding just prints a couple of ‘captions’ and \today in Danish and Vietnamese. No additional packages are required.

LUATEX/XETEX

```
\documentclass{article}

\usepackage[vietnamese,danish]{babel}

\begin{document}

\prefacename{} -- \alsoname{} -- \today

\selectlanguage{vietnamese}

\prefacename{} -- \alsoname{} -- \today

\end{document}
```

1.3 Mostly monolingual documents

New 3.39 Very often, multilingual documents consist of a main language with small pieces of text in another languages (words, idioms, short sentences). Typically, all you need is to set the line breaking rules and, perhaps, the font. In such a case, babel now does not require declaring these secondary languages explicitly, because the basic settings are loaded on the fly when the language is selected (and also when provided in the optional argument of \babelfont, if used.)

This is particularly useful, too, when there are short texts of this kind coming from an external source whose contents are not known on beforehand (for example, titles in a bibliography). At this regard, it is worth remembering that \babelfont does not load any font until required, so that it can be used just in case.

EXAMPLE A trivial document is:

LUATEX/XETEX

```
\documentclass{article}
\usepackage[english]{babel}
```

```

\babelfont[russian]{rm}{FreeSerif}

\begin{document}

English. \foreignlanguage{russian}{Русский}.
\foreignlanguage{spanish}{Español}

\end{document}

```

1.4 Modifiers

New 3.9c The basic behavior of some languages can be modified when loading babel by means of *modifiers*. They are set after the language name, and are prefixed with a dot (only when the language is set as package option – neither global options nor the main key accepts them). An example is (spaces are not significant and they can be added or removed):¹

```
\usepackage[latin.medieval, spanish.notilde.lcroman, danish]{babel}
```

Attributes (described below) are considered modifiers, ie, you can set an attribute by including it in the list of modifiers. However, modifiers are a more general mechanism.

1.5 Troubleshooting

- Loading directly sty files in L^AT_EX (ie, `\usepackage{⟨language⟩}`) is deprecated and you will get the error:²

```

! Package babel Error: You are loading directly a language style.
(babel)                This syntax is deprecated and you must use
(babel)                \usepackage[language]{babel}.

```

- Another typical error when using babel is the following:³

```

! Package babel Error: Unknown language `#1'. Either you have
(babel)                misspelled its name, it has not been installed,
(babel)                or you requested it in a previous run. Fix its name,
(babel)                install it or just rerun the file, respectively. In
(babel)                some cases, you may need to remove the aux file

```

The most frequent reason is, by far, the latest (for example, you included spanish, but you realized this language is not used after all, and therefore you removed it from the option list). In most cases, the error vanishes when the document is typeset again, but in more severe ones you will need to remove the aux file.

1.6 Plain

In Plain, load languages styles with `\input` and then use `\begindocument` (the latter is defined by babel):

¹No predefined “axis” for modifiers are provided because languages and their scripts have quite different needs.

²In old versions the error read “You have used an old interface to call babel”, not very helpful.

³In old versions the error read “You haven’t loaded the language LANG yet”.

```
\input estonian.sty
\begindocument
```

WARNING Not all languages provide a sty file and some of them are not compatible with Plain.⁴

1.7 Basic language selectors

This section describes the commands to be used in the document to switch the language in multilingual documents. In most cases, only the two basic macros `\selectlanguage` and `\foreignlanguage` are necessary. The environments `otherlanguage`, `otherlanguage*` and `hyphenrules` are auxiliary, and described in the next section.

The main language is selected automatically when the document environment begins.

`\selectlanguage` $\{\langle language \rangle\}$

When a user wants to switch from one language to another he can do so using the macro `\selectlanguage`. This macro takes the language, defined previously by a language definition file, as its argument. It calls several macros that should be defined in the language definition files to activate the special definitions for the language chosen:

```
\selectlanguage{german}
```

This command can be used as environment, too.

NOTE For “historical reasons”, a macro name is converted to a language name without the leading `\`; in other words, `\selectlanguage{\german}` is equivalent to `\selectlanguage{german}`. Using a macro instead of a “real” name is deprecated.

WARNING If used inside braces there might be some non-local changes, as this would be roughly equivalent to:

```
{\selectlanguage{<inner-language>} ...}\selectlanguage{<outer-language>}
```

If you want a change which is really local, you must enclose this code with an additional grouping level.

`\foreignlanguage` $\{\langle language \rangle\}\{\langle text \rangle\}$

The command `\foreignlanguage` takes two arguments; the second argument is a phrase to be typeset according to the rules of the language named in its first one. This command (1) only switches the extra definitions and the hyphenation rules for the language, *not* the names and dates, (2) does not send information about the language to auxiliary files (i.e., the surrounding language is still in force), and (3) it works even if the language has not been set as package option (but in such a case it only sets the hyphenation patterns and a warning is shown). With the `bidirules` option, it also enters in horizontal mode (this is not done always for backwards compatibility).

1.8 Auxiliary language selectors

`\begin{otherlanguage}` $\langle\textit{language}\rangle$... `\end{otherlanguage}`

The environment `otherlanguage` does basically the same as `\selectlanguage`, except that language change is (mostly) local to the environment.

Actually, there might be some non-local changes, as this environment is roughly equivalent to:

```
\begingroup
\selectlanguage{<inner-language>}
...
\endgroup
\selectlanguage{<outer-language>}
```

If you want a change which is really local, you must enclose this environment with an additional grouping, like braces `{}`.

Spaces after the environment are ignored.

`\begin{otherlanguage*}` $\langle\textit{language}\rangle$... `\end{otherlanguage*}`

Same as `\foreignlanguage` but as environment. Spaces after the environment are *not* ignored.

This environment was originally intended for intermixing left-to-right typesetting with right-to-left typesetting in engines not supporting a change in the writing direction inside a line. However, by default it never complied with the documented behavior and it is just a version as environment of `\foreignlanguage`, except when the option `bidi` is set – in this case, `\foreignlanguage` emits a `\leavevmode`, while `otherlanguage*` does not.

`\begin{hyphenrules}` $\langle\textit{language}\rangle$... `\end{hyphenrules}`

The environment `hyphenrules` can be used to select *only* the hyphenation rules to be used (it can be used as command, too). This can for instance be used to select ‘nohyphenation’, provided that in `language.dat` the ‘language’ `nohyphenation` is defined by loading `zerohyph.tex`. It deactivates language shorthands, too (but not user shorthands). Except for these simple uses, `hyphenrules` is discouraged and `otherlanguage*` (the starred version) is preferred, as the former does not take into account possible changes in encodings of characters like, say, ‘ done by some languages (eg. italian, french, ukraineb). To set hyphenation exceptions, use `\babelhyphenation` (see below).

1.9 More on selection

`\babeltags` $\langle\textit{tag1}\rangle = \langle\textit{language1}\rangle, \langle\textit{tag2}\rangle = \langle\textit{language2}\rangle, \dots$

New 3.9i In multilingual documents with many language-switches the commands above can be cumbersome. With this tool shorter names can be defined. It adds nothing really new – it is just syntactical sugar.

It defines `\text{<tag1>}{<text>}` to be `\foreignlanguage{<language1>}{<text>}`, and `\begin{<tag1>}` to be `\begin{otherlanguage*}{<language1>}`, and so on. Note `\langle\textit{tag1}\rangle` is also allowed, but remember to set it locally inside a group.

EXAMPLE With

⁴Even in the babel kernel there were some macros not compatible with plain. Hopefully these issues have been fixed.

```
\babeltags{de = german}
```

you can write

```
text \textde{German text} text
```

and

```
text
\begin{de}
  German text
\end{de}
text
```

NOTE Something like `\babeltags{finnish = finnish}` is legitimate – it defines `\textfinnish` and `\finnish` (and, of course, `\begin{finnish}`).

NOTE Actually, there may be another advantage in the ‘short’ syntax `\text⟨tag⟩`, namely, it is not affected by `\MakeUppercase` (while `\foreignlanguage` is).

\babelensure [`include=⟨commands⟩`, `exclude=⟨commands⟩`, `fontenc=⟨encoding⟩`]{`⟨language⟩`}

New 3.9i Except in a few languages, like russian, captions and dates are just strings, and do not switch the language. That means you should set it explicitly if you want to use them, or hyphenation (and in some cases the text itself) will be wrong. For example:

```
\foreignlanguage{russian}{text \foreignlanguage{polish}{\seename} text}
```

Of course, \TeX can do it for you. To avoid switching the language all the while, `\babelensure` redefines the captions for a given language to wrap them with a selector:

```
\babelensure{polish}
```

By default only the basic captions and `\today` are redefined, but you can add further macros with the key `include` in the optional argument (without commas). Macros not to be modified are listed in `exclude`. You can also enforce a font encoding with `fontenc`.⁵ A couple of examples:

```
\babelensure[include=\Today]{spanish}
\babelensure[fontenc=T5]{vietnamese}
```

They are activated when the language is selected (at the `afterextras` event), and it makes some assumptions which could not be fulfilled in some languages. Note also you should include only macros defined by the language, not global macros (eg, `\TeX` or `\dag`). With `ini` files (see below), captions are ensured by default.

⁵With it, encoded strings may not work as expected.

1.10 Shorthands

A *shorthand* is a sequence of one or two characters that expands to arbitrary TeX code. Shorthands can be used for different kinds of things, for example: (1) in some languages shorthands such as "a are defined to be able to hyphenate the word if the encoding is OT1; (2) in some languages shorthands such as ! are used to insert the right amount of white space; (3) several kinds of discretionaries and breaks can be inserted easily with "-", "=", etc. The package inputenc as well as xetex and luatex have alleviated entering non-ASCII characters, but minority languages and some kinds of text can still require characters not directly available on the keyboards (and sometimes not even as separated or precomposed Unicode characters). As to the point 2, now pdfTeX provides \knbccode, and luatex can manipulate the glyph list. Tools for point 3 can be still very useful in general. There are three levels of shorthands: *user*, *language*, and *system* (by order of precedence). Version 3.9 introduces the *language user* level on top of the user level, as described below. In most cases, you will use only shorthands provided by languages.

NOTE Note the following:

1. Activated chars used for two-char shorthands cannot be followed by a closing brace } and the spaces following are gobbled. With one-char shorthands (eg, :), they are preserved.
2. If on a certain level (system, language, user) there is a one-char shorthand, two-char ones starting with that char and on the same level are ignored.
3. Since they are active, a shorthand cannot contain the same character in its definition (except if it is deactivated with, eg, \string).

TROUBLESHOOTING A typical error when using shorthands is the following:

```
! Argument of \language@active@arg" has an extra }.
```

It means there is a closing brace just after a shorthand, which is not allowed (eg, "). Just add {} after (eg, "{}}).

`\shorthandon` `{\shorthands-list}`
`\shorthandoff` `*{\shorthands-list}`

It is sometimes necessary to switch a shorthand character off temporarily, because it must be used in an entirely different way. For this purpose, the user commands \shorthandoff and \shorthandon are provided. They each take a list of characters as their arguments. The command \shorthandoff sets the \catcode for each of the characters in its argument to other (12); the command \shorthandon sets the \catcode to active (13). Both commands only work on 'known' shorthand characters.

New 3.9a However, \shorthandoff does not behave as you would expect with characters like ~ or ^, because they usually are not "other". For them \shorthandoff* is provided, so that with

```
\shorthandoff*{~^}
```

~ is still active, very likely with the meaning of a non-breaking space, and ^ is the superscript character. The catcodes used are those when the shorthands are defined, usually when language files are loaded.

If you do not need shorthands, or prefer an alternative approach of your own, you may want to switch them off with the package option shorthands=off, as described below.

`\usesshorthands` `*{\langle char \rangle}`

The command `\usesshorthands` initiates the definition of user-defined shorthand sequences. It has one argument, the character that starts these personal shorthands.

New 3.9a User shorthands are not always alive, as they may be deactivated by languages (for example, if you use " for your user shorthands and switch from german to french, they stop working). Therefore, a starred version `\usesshorthands*{\langle char \rangle}` is provided, which makes sure shorthands are always activated.

Currently, if the package option `shorthands` is used, you must include any character to be activated with `\usesshorthands`. This restriction will be lifted in a future release.

`\defineshorthand` `[\langle language \rangle, \langle language \rangle, \dots]{\langle shorthand \rangle}{\langle code \rangle}`

The command `\defineshorthand` takes two arguments: the first is a one- or two-character shorthand sequence, and the second is the code the shorthand should expand to.

New 3.9a An optional argument allows to (re)define language and system shorthands (some languages do not activate shorthands, so you may want to add `\languageshorthands{\langle lang \rangle}` to the corresponding `\extras{\langle lang \rangle}`, as explained below). By default, user shorthands are (re)defined.

User shorthands override language ones, which in turn override system shorthands.

Language-dependent user shorthands (new in 3.9) take precedence over “normal” user shorthands.

EXAMPLE Let’s assume you want a unified set of shorthand for dictionaries (languages do not define shorthands consistently, and “-”, “\”, “=” have different meanings). You could start with, say:

```
\usesshorthands*{"}
\defineshorthand{"*}{\babelhyphen{soft}}
\defineshorthand{"-}{\babelhyphen{hard}}
```

However, the behavior of hyphens is language-dependent. For example, in languages like Polish and Portuguese, a hard hyphen inside compound words is repeated at the beginning of the next line. You could then set:

```
\defineshorthand[*polish,*portuguese]{"-}{\babelhyphen{repeat}}
```

Here, options with `*` set a language-dependent user shorthand, which means the generic one above only applies for the rest of languages; without `*` they would (re)define the language shorthands instead, which are overridden by user ones.

Now, you have a single unified shorthand (“-”), with a content-based meaning (‘compound word hyphen’) whose visual behavior is that expected in each context.

`\languageshorthands` `{\langle language \rangle}`

The command `\languageshorthands` can be used to switch the shorthands on the language level. It takes one argument, the name of a language or none (the latter does what its name suggests).⁶ Note that for this to work the language should have been specified as an option when loading the babel package. For example, you can use in english the shorthands defined by `ngerman` with

⁶Actually, any name not corresponding to a language group does the same as none. However, follow this convention because it might be enforced in future releases of babel to catch possible errors.

```
\addto\extrasenglish{\languageshorthands{ngerman}}
```

(You may also need to activate them as user shorthands in the preamble with, for example, `\useshorthands` or `\useshorthands*`.)

EXAMPLE Very often, this is a more convenient way to deactivate shorthands than `\shorthandoff`, for example if you want to define a macro to easy typing phonetic characters with tipa:

```
\newcommand{\myipa}[1]{\{\languageshorthands{none}\tipaencoding#1}}
```

`\babelshorthand` $\{\langle shorthand \rangle\}$

With this command you can use a shorthand even if (1) not activated in shorthands (in this case only shorthands for the current language are taken into account, ie, not user shorthands), (2) turned off with `\shorthandoff` or (3) deactivated with the internal `\bbl@deactivate`; for example, `\babelshorthand{"u}` or `\babelshorthand{:}`. (You can conveniently define your own macros, or even your own user shorthands provided they do not overlap.)

EXAMPLE Since by default shorthands are not activated until `\begin{document}`, you may use this macro when defining the `\title` in the preamble:

```
\title{Documento científico\babelshorthand{"-}técnico}
```

For your records, here is a list of shorthands, but you must double check them, as they may change:⁷

Languages with no shorthands Croatian, English (any variety), Indonesian, Hebrew, Interlingua, Irish, Lower Sorbian, Malaysian, North Sami, Romanian, Scottish, Welsh

Languages with only " as defined shorthand character Albanian, Bulgarian, Danish, Dutch, Finnish, German (old and new orthography, also Austrian), Icelandic, Italian, Norwegian, Polish, Portuguese (also Brazilian), Russian, Serbian (with Latin script), Slovene, Swedish, Ukrainian, Upper Sorbian

Basque " ' ~

Breton : ; ? !

Catalan " ' `

Czech " -

Esperanto ^

Estonian " ~

French (all varieties) : ; ? !

Galician " . ' ~ < >

Greek ~

Hungarian `

Kurmanji ^

Latin " ^ =

Slovak " ^ ' -

Spanish " . < > ' ~

Turkish : ! =

In addition, the babel core declares ~ as a one-char shorthand which is let, like the standard ~, to a non breaking space.⁸

⁷Thanks to Enrico Gregorio

⁸This declaration serves to nothing, but it is preserved for backward compatibility.

\ifbabelshorthand $\{\langle character \rangle\}\{\langle true \rangle\}\{\langle false \rangle\}$

New 3.23 Tests if a character has been made a shorthand.

\aliasshorthand $\{\langle original \rangle\}\{\langle alias \rangle\}$

The command `\aliasshorthand` can be used to let another character perform the same functions as the default shorthand character. If one prefers for example to use the character `/` over `"` in typing Polish texts, this can be achieved by entering `\aliasshorthand{/}{/}`. For the reasons in the warning below, usage of this macro is not recommended.

NOTE The substitute character must *not* have been declared before as shorthand (in such a case, `\aliasshorthands` is ignored).

EXAMPLE The following example shows how to replace a shorthand by another

```
\aliasshorthand{~}{^}
\AtBeginDocument{\shorthandoff{~}}
```

WARNING Shorthands remember somehow the original character, and the fallback value is that of the latter. So, in this example, if no shorthand is found, `^` expands to a non-breaking space, because this is the value of `~` (internally, `^` still calls `\active@char~` or `\normal@char~`). Furthermore, if you change the system value of `^` with `\defineshorthand` nothing happens.

1.11 Package options

New 3.9a These package options are processed before language options, so that they are taken into account irrespective of its order. The first three options have been available in previous versions.

KeepShorthandsActive Tells babel not to deactivate shorthands after loading a language file, so that they are also available in the preamble.

activeacute For some languages babel supports this options to set `'` as a shorthand in case it is not done by default.

activegrave Same for ```.

shorthands= $\langle char \rangle \langle char \rangle \dots \mid \text{off}$

The only language shorthands activated are those given, like, eg:

```
\usepackage[esperanto,french,shorthands=;!?]{babel}
```

If `'` is included, `activeacute` is set; if ``` is included, `activegrave` is set. Active characters (like `~`) should be preceded by `\string` (otherwise they will be expanded by \LaTeX before they are passed to the package and therefore they will not be recognized); however, `t` is provided for the common case of `~` (as well as `c` for not so common case of the comma). With `shorthands=off` no language shorthands are defined. As some languages use this mechanism for tools not available otherwise, a macro `\babelshorthand` is defined, which allows using them; see above.

safe=	none ref bib
	Some \LaTeX macros are redefined so that using shorthands is safe. With <code>safe=bib</code> only <code>\nocite</code> , <code>\bibcite</code> and <code>\bibitem</code> are redefined. With <code>safe=ref</code> only <code>\newlabel</code> , <code>\ref</code> and <code>\pageref</code> are redefined (as well as a few macros from <code>varioref</code> and <code>ifthen</code>). With <code>safe=none</code> no macro is redefined. This option is strongly recommended, because a good deal of incompatibilities and errors are related to these redefinitions. As of New 3.34 , in $\epsilon\TeX$ based engines (ie, almost every engine except the oldest ones) shorthands can be used in these macros (formerly you could not).
math=	active normal
	Shorthands are mainly intended for text, not for math. By setting this option with the value <code>normal</code> they are deactivated in math mode (default is <code>active</code>) and things like <code>#{a'}</code> (a closing brace after a shorthand) are not a source of trouble anymore.
config=	$\langle file \rangle$
	Load $\langle file \rangle$.cfg instead of the default config file <code>bblopts.cfg</code> (the file is loaded even with <code>noconfigs</code>).
main=	$\langle language \rangle$
	Sets the main language, as explained above, ie, this language is always loaded last. If it is not given as package or global option, it is added to the list of requested languages.
headfoot=	$\langle language \rangle$
	By default, headlines and footlines are not touched (only marks), and if they contain language-dependent macros (which is not usual) there may be unexpected results. With this option you may set the language in heads and foots.
noconfigs	Global and language default config files are not loaded, so you can make sure your document is not spoilt by an unexpected .cfg file. However, if the key config is set, this file is loaded.
showlanguages	Prints to the log the list of languages loaded when the format was created: number (remember dialects can share it), name, hyphenation file and exceptions file.
nocase	New 3.91 Language settings for uppercase and lowercase mapping (as set by <code>\SetCase</code>) are ignored. Use only if there are incompatibilities with other packages.
silent	New 3.91 No warnings and no <i>infos</i> are written to the log file. ⁹
strings=	generic unicode encoded $\langle label \rangle$ $\langle font encoding \rangle$
	Selects the encoding of strings in languages supporting this feature. Predefined labels are <code>generic</code> (for traditional \TeX , LICR and ASCII strings), <code>unicode</code> (for engines like <code>xetex</code> and <code>luatex</code>) and <code>encoded</code> (for special cases requiring mixed encodings). Other allowed values are font encoding codes (T1, T2A, LGR, L7X...), but only in languages supporting them. Be aware with encoded captions are protected, but they work in <code>\MakeUpper</code> case and the like (this feature misuses some internal \LaTeX tools, so use it only as a last resort).
hyphenmap=	off first select other other*

⁹You can use alternatively the package `silence`.

New 3.9g Sets the behavior of case mapping for hyphenation, provided the language defines it.¹⁰ It can take the following values:

off deactivates this feature and no case mapping is applied;
first sets it at the first switching commands in the current or parent scope (typically, when the aux file is first read and at `\begin{document}`), but also the first `\selectlanguage` in the preamble), and it's the default if a single language option has been stated;¹¹
select sets it only at `\selectlanguage`;
other also sets it at `otherlanguage`;
other* also sets it at `otherlanguage*` as well as in heads and foots (if the option `headfoot` is used) and in auxiliary files (ie, at `\select@language`), and it's the default if several language options have been stated. The option `first` can be regarded as an optimized version of `other*` for monolingual documents.¹²

bidi= default | basic | basic-r | bidi-l | bidi-r

New 3.14 Selects the bidi algorithm to be used in `luatex` and `xetex`. See sec. 1.21.

layout=

New 3.16 Selects which layout elements are adapted in bidi documents. See sec. 1.21.

1.12 The base option

With this package option `babel` just loads some basic macros (those in `switch.def`), defines `\AfterBabelLanguage` and exits. It also selects the hyphenation patterns for the last language passed as option (by its name in `language.dat`). There are two main uses: classes and packages, and as a last resort in case there are, for some reason, incompatible languages. It can be used if you just want to select the hyphenation patterns of a single language, too.

\AfterBabelLanguage `{\langle option-name \rangle}{\langle code \rangle}`

This command is currently the only provided by `base`. Executes `\langle code \rangle` when the file loaded by the corresponding package option is finished (at `\ldf@finish`). The setting is global. So

```
\AfterBabelLanguage{french}{...}
```

does ... at the end of `french.ldf`. It can be used in `ldf` files, too, but in such a case the code is executed only if `\langle option-name \rangle` is the same as `\CurrentOption` (which could not be the same as the option name as set in `\usepackage!`).

EXAMPLE Consider two languages `foo` and `bar` defining the same `\macro` with `\newcommand`. An error is raised if you attempt to load both. Here is a way to overcome this problem:

¹⁰Turned off in plain.

¹¹Duplicated options count as several ones.

¹²Providing `foreign` is pointless, because the case mapping applied is that at the end of the paragraph, but if either `xetex` or `luatex` change this behavior it might be added. On the other hand, `other` is provided even if I [JBL] think it isn't really useful, but who knows.

```

\usepackage[base]{babel}
\AfterBabelLanguage{foo}{%
  \let\macroFoo\macro
  \let\macro\relax}
\usepackage[foo,bar]{babel}

```

WARNING Currently this option is not compatible with languages loaded on the fly.

1.13 ini files

An alternative approach to define a language (or, more precisely, a *locale*) is by means of an ini file. Currently babel provides about 200 of these files containing the basic data required for a locale.

ini files are not meant only for babel, and they have been devised as a resource for other packages. To ease interoperability between T_EX and other systems, they are identified with the BCP 47 codes as preferred by the Unicode Common Language Data Repository, which was used as source for most of the data provided by these files, too (the main exception being the `\ldots` name strings).

Most of them set the date, and many also the captions (Unicode and LICR). They will be evolving with the time to add more features (something to keep in mind if backward compatibility is important). The following section shows how to make use of them currently (by means of `\babelprovide`), but a higher interface, based on package options, is under study. In other words, `\babelprovide` is mainly meant for auxiliary tasks.

EXAMPLE Although Georgian has its own ldf file, here is how to declare this language with an ini file in Unicode engines.

LUATEX/XETEX

```

\documentclass{book}

\usepackage{babel}
\babelprovide[import, main]{georgian}

\babelfont{rm}{DejaVu Sans}

\begin{document}

\tableofcontents

\chapter{სამზარეულო და სუფრის ტრადიციები}

ქართული ტრადიციული სამზარეულო ერთ-ერთი უმდიდრესია მთელ მსოფლიოში.

\end{document}

```

NOTE The ini files just define and set some parameters, but the corresponding behavior is not always implemented. Also, there are some limitations in the engines. A few remarks follows:

Arabic Monolingual documents mostly work in luatex, but it must be fine tuned, and a recent version of fontspec/loaotfloat is required. In xetex babel resorts to the bidi package, which seems to work.

Hebrew Niqqud marks seem to work in both engines, but cantillation marks are misplaced (xetex or luatex with Harfbuzz seems better, but still problematic).

Devanagari In luatex and the the default renderer many fonts work, but some others do not, the main issue being the ‘ra’. It is advisable to set explicitly the script to either deva or dev2, eg:

```
\newfontscript{Devanagari}{deva}
```

Other Indic scripts are still under development in the default `luatex` renderer, but should work with the option `Renderer=Harfbuzz` in `FONTSPEC`. They also work with `xetex`, although fine tuning the font behaviour is not always possible.

Southeast scripts Thai works in both `luatex` and `xetex`, but line breaking differs (rules can be modified in `luatex`; they are hard-coded in `xetex`). Lao seems to work, too, but there are no patterns for the latter in `luatex`. Khemer clusters are rendered wrongly with the default renderer. The comment about Indic scripts and `lualatex` also applies here. Some quick patterns could help, with something similar to:

```
\babelprovide[import,hyphenrules=+]{lao}
\babelpatterns[lao]{໐໑ ໑໒ ໑໓ ໑໔ ໑໕} % Random
```

East Asia scripts Settings for either Simplified or Traditional should work out of the box, with basic line breaking. Although for a few words and short texts the ini files should be fine, CJK texts are best set with a dedicated framework (CJK, luatexja, kotex, CTeX, etc.). This is what the class `ltjbook` does with `luatex`, which can be used in conjunction with the `ldf` for `japanese`, because the following piece of code loads `luatexja`:

```
\documentclass{ltjbook}
\usepackage[japanese]{babel}
```

NOTE Wikipedia defines a *locale* as follows: “In computing, a locale is a set of parameters that defines the user’s language, region and any special variant preferences that the user wants to see in their user interface. Usually a locale identifier consists of at least a language code and a country/region code.” Babel is moving gradually from the old and fuzzy concept of *language* to the more modern of *locale*. Note each locale is by itself a separate “language”, which explains why there are so many files. This is on purpose, so that possible variants can be created and/or redefined easily.

Here is the list (u means Unicode captions, and l means LICR captions):

Modifying and adding values to ini files

New 3.39 There is a way to modify the values of ini files when they get loaded with `\babelprovide` and `import`. To set, say, `digits.native` in the numbers section, use something like `numbers/digits.native=abcdefghijklj`. Keys may be added, too. Without `import` you may modify the identification keys.

This can be used to create private variants easily. All you need is to import the same ini file with a different locale name and different parameters.

1.14 Selecting fonts

New 3.15 Babel provides a high level interface on top of `fontspec` to select fonts. There is no need to load `fontspec` explicitly – babel does it for you with the first `\babelfont`.¹⁴

`\babelfont` [*<language-list>*]{*<font-family>*}[*<font-options>*]{*<font-name>*}

The main purpose of `\babelfont` is to define at once in a multilingual document the fonts required by the different languages, with their corresponding language systems (script and language). So, if you load, say, 4 languages, `\babelfont{rm}{FreeSerif}` defines 4 fonts (with their variants, of course), which are switched with the language by babel. It is a tool to make things easier and transparent to the user.

Here *font-family* is `rm`, `sf` or `tt` (or newly defined ones, as explained below), and *font-name* is the same as in `fontspec` and the like.

If no language is given, then it is considered the default font for the family, activated when a language is selected.

On the other hand, if there is one or more languages in the optional argument, the font will be assigned to them, overriding the default one. Alternatively, you may set a font for a script – just precede its name (lowercase) with a star (eg, `*devanagari`). With this optional argument, the font is *not* yet defined, but just predeclared. This means you may define as many fonts as you want ‘just in case’, because if the language is never selected, the corresponding `\babelfont` declaration is just ignored.

Babel takes care of the font language and the font script when languages are selected (as well as the writing direction); see the recognized languages above. In most cases, you will

¹⁴See also the package `combofont` for a complementary approach.

not need *font-options*, which is the same as in fontspec, but you may add further key/value pairs if necessary.

EXAMPLE Usage in most cases is very simple. Let us assume you are setting up a document in Swedish, with some words in Hebrew, with a font suited for both languages.

LUATEX/XETEX

```
\documentclass{article}

\usepackage[swedish, bidi=default]{babel}

\babelprovide[import]{hebrew}

\babelfont{rm}{FreeSerif}

\begin{document}

Svenska \foreignlanguage{hebrew}{עברית} svenska.

\end{document}
```

If on the other hand you have to resort to different fonts, you could replace the red line above with, say:

LUATEX/XETEX

```
\babelfont{rm}{Iwona}
\babelfont[hebrew]{rm}{FreeSerif}
```

`\babelfont` can be used to implicitly define a new font family. Just write its name instead of `rm`, `sf` or `tt`. This is the preferred way to select fonts in addition to the three basic families.

EXAMPLE Here is how to do it:

LUATEX/XETEX

```
\babelfont{kai}{FandolKai}
```

Now, `\kaifamily` and `\kaidefault`, as well as `\textkai` are at your disposal.

NOTE You may load fontspec explicitly. For example:

LUATEX/XETEX

```
\usepackage{fontspec}
\newfontscript{Devanagari}{deva}
\babelfont[hindi]{rm}{Shobhika}
```

This makes sure the OpenType script for Devanagari is `deva` and not `dev2`, in case it is not detected correctly. You may also pass some options to fontspec: with `silent`, the warnings about unavailable scripts or languages are not shown (they are only really useful when the document format is being set up).

NOTE Directionality is a property affecting margins, indentation, column order, etc., not just text. Therefore, it is under the direct control of the language, which applies both the script and the direction to the text. As a consequence, there is no need to set `Script` when declaring a font with `\babelfont` (nor `Language`). In fact, it is even discouraged.

NOTE `\fontspec` is not touched at all, only the preset font families (`rm`, `sf`, `tt`, and the like). If a language is switched when an *ad hoc* font is active, or you select the font with this command, neither the script nor the language is passed. You must add them by hand. This is by design, for several reasons—for example, each font has its own set of features and a generic setting for several of them could be problematic, and also a “lower-level” font selection is useful.

NOTE The keys `Language` and `Script` just pass these values to the *font*, and do *not* set the script for the *language* (and therefore the writing direction). In other words, the `ini` file or `\babelprovide` provides default values for `\babelfont` if omitted, but the opposite is not true. See the note above for the reasons of this behavior.

WARNING Using `\setxxxxfont` and `\babelfont` at the same time is discouraged, but very often works as expected. However, be aware with `\setxxxxfont` the language system will not be set by `babel` and should be set with `fontspec` if necessary.

TROUBLESHOOTING *Package fontspec Warning: ‘Language ‘LANG’ not available for font ‘FONT’ with script ‘SCRIPT’ ‘Default’ language used instead’.*

This is *not* and error. This warning is shown by `fontspec`, not by `babel`. It could be irrelevant for English, but not for many other languages, including Urdu and Turkish. This is a useful and harmless warning, and if everything is fine with your document the best thing you can do is just to ignore it altogether.

TROUBLESHOOTING *Package babel Info: The following fonts are not babel standard families.*

This is *not* and error. `babel` assumes that if you are using `\babelfont` for a family, very likely you want to define the rest of them. If you don’t, you can find some inconsistencies between families. This checking is done at the beginning of the document, at a point where we cannot know which families will be used.

Actually, there is no real need to use `\babelfont` in a monolingual document, if you set the language system in `\setmainfont` (or not, depending on what you want).

As the message explains, *there is nothing intrinsically wrong* with not defining all the families. In fact, there is nothing intrinsically wrong with not using `\babelfont` at all. But you must be aware that this may lead to some problems.

1.15 Modifying a language

Modifying the behavior of a language (say, the chapter “caption”), is sometimes necessary, but not always trivial.

- The old way, still valid for many languages, to redefine a caption is the following:

```
\addto\captionsenglish{%  
  \renewcommand\contentsname{Foo}%  
}
```

As of 3.15, there is no need to hide spaces with `%` (`babel` removes them), but it is advisable to do so.

- The new way, which is found in `bulgarian`, `azerbaijani`, `spanish`, `french`, `turkish`, `icelandic`, `vietnamese` and a few more, as well as in languages created with `\babelprovide` and its key `import`, is:

```
\renewcommand\spanishchaptername{Foo}
```

- Macros to be run when a language is selected can be add to `\extras⟨lang⟩`:

```
\addto\extrasrussian{\mymacro}
```

There is a counterpart for code to be run when a language is unselected:
`\noextras⟨lang⟩`.

NOTE Do *not* redefine a caption in the following way:

```
\AtBeginDocument{\renewcommand\contentsname{Foo}}
```

The changes may be discarded with a language selector, and the original value restored.

NOTE These macros (`\captions⟨lang⟩`, `\extras⟨lang⟩`) may be redefined, but *must not* be used as such – they just pass information to babel, which executes them in the proper context.

Another way to modify a language loaded as a package or class option is by means of `\babelprovide`, described below in depth. So, something like:

```
\usepackage[danish]{babel}  
\babelprovide[captions=da,hyphenrules=nohyphenation]{danish}
```

first loads `danish.ldf`, and then redefines the captions for danish (as provided by the `ini` file) and prevents hyphenation. The rest of the language definitions are not touched.

1.16 Creating a language

New 3.10 And what if there is no style for your language or none fits your needs? You may then define quickly a language with the help of the following macro in the preamble (which may be used to modify an existing language, too, as explained in the previous subsection).

`\babelprovide` [`⟨options⟩`] {`⟨language-name⟩`}

If the language `⟨language-name⟩` has not been loaded as class or package option and there are no `⟨options⟩`, it creates an “empty” one with some defaults in its internal structure: the hyphen rules, if not available, are set to the current ones, left and right hyphen mins are set to 2 and 3. In either case, caption, date and language system are not defined.

If no `ini` file is imported with `import`, `⟨language-name⟩` is still relevant because in such a case the hyphenation and like breaking rules (including those for South East Asian and CJK) are based on it as provided in the `ini` file corresponding to that name; the same applies to OpenType language and script.

Conveniently, some options allow to fill the language, and babel warns you about what to do if there is a missing string. Very likely you will find alerts like that in the log file:

```
Package babel Warning: \mylangchaptername not set. Please, define  
(babel) it in the preamble with something like:  
(babel) \renewcommand\mylangchaptername{..}  
(babel) Reported on input line 18.
```

In most cases, you will only need to define a few macros.

EXAMPLE If you need a language named arhinish:

```
\usepackage[danish]{babel}
\babelprovide{arhinish}
\renewcommand\arhinishchaptername{Chapitula}
\renewcommand\arhinishrefname{Refirenke}
\renewcommand\arhinishhyphenmins{22}
```

EXAMPLE Locales with names based on BCP 47 codes can be created with something like:

```
\babelprovide[import=en-US]{enUS}
```

Note, however, mixing ways to identify locales can lead to problems. For example, is yi the name of the language spoken by the Yi people or is it the code for Yiddish?

The main language is not changed (danish in this example). So, you must add `\selectlanguage{arhinish}` or other selectors where necessary. If the language has been loaded as an argument in `\documentclass` or `\usepackage`, then `\babelprovide` redefines the requested data.

import= *<language-tag>*

New 3.13 Imports data from an ini file, including captions, date, and hyphenmins. For example:

```
\babelprovide[import=hu]{hungarian}
```

Unicode engines load the UTF-8 variants, while 8-bit engines load the LICR (ie, with macros like `\'` or `\ss`) ones.

New 3.23 It may be used without a value. In such a case, the ini file set in the corresponding `babel-<language>.tex` (where `<language>` is the last argument in `\babelprovide`) is imported. See the list of recognized languages above. So, the previous example could be written:

```
\babelprovide[import]{hungarian}
```

There are about 200 ini files, with data taken from the ldf files and the CLDR provided by Unicode. Not all languages in the latter are complete, and therefore neither are the ini files. A few languages will show a warning about the current lack of suitability of the date format (french, breton, and occitan).

Besides `\today`, this option defines an additional command for dates: `\<language>date`, which takes three arguments, namely, year, month and day numbers. In fact, `\today` calls `\<language>today`, which in turn calls `\<language>date{\the\year}{\the\month}{\the\day}`.

captions= *<language-tag>*

Loads only the strings. For example:

```
\babelprovide[captions=hu]{hungarian}
```

hyphenrules= $\langle\textit{language-list}\rangle$

With this option, with a space-separated list of hyphenation rules, babel assigns to the language the first valid hyphenation rules in the list. For example:

```
\babelprovide[hyphenrules=chavacano spanish italian]{chavacano}
```

If none of the listed hyphenrules exist, the default behavior applies. Note in this example we set chavacano as first option – without it, it would select spanish even if chavacano exists.

A special value is +, which allocates a new language (in the T_EX sense). It only makes sense as the last value (or the only one; the subsequent ones are silently ignored). It is mostly useful with luatex, because you can add some patterns with \babelpatterns, as for example:

```
\babelprovide[hyphenrules=+]{neo}  
\babelpatterns[neo]{a1 e1 i1 o1 u1}
```

In other engines it just suppresses hyphenation (because the pattern list is empty).

main This valueless option makes the language the main one. Only in newly defined languages.

script= $\langle\textit{script-name}\rangle$

New 3.15 Sets the script name to be used by fontspec (eg, Devanagar i). Overrides the value in the ini file. If fontspec does not define it, then babel sets its tag to that provided by the ini file. This value is particularly important because it sets the writing direction, so you must use it if for some reason the default value is wrong.

language= $\langle\textit{language-name}\rangle$

New 3.15 Sets the language name to be used by fontspec (eg, Hindi). Overrides the value in the ini file. If fontspec does not define it, then babel sets its tag to that provided by the ini file. Not so important, but sometimes still relevant.

A few options (only luatex) set some properties of the writing system used by the language. These properties are *always* applied to the script, no matter which language is active. Although somewhat inconsistent, this makes setting a language up easier in most typical cases.

onchar= ids | fonts

New 3.38 This option is much like an ‘event’ called when a character belonging to the script of this locale is found. There are currently two ‘actions’, which can be used at the same time (separated by a space): with ids the \language and the \localeid are set to the values of this locale; with fonts, the fonts are changed to those of this locale (as set with \babelfont). This option is not compatible with mapfont. Characters can be added with \babelcharproperty.

mapfont= direction

Assigns the font for the writing direction of this language (only with `bidi=basic`). Whenever possible, instead of this option use `onchar`, based on the script, which usually makes more sense. More precisely, what `mapfont=direction` means is, ‘when a character has the same direction as the script for the “provided” language, then change its font to that set for this language’. There are 3 directions, following the bidi Unicode algorithm, namely, Arabic-like, Hebrew-like and left to right. So, there should be at most 3 directives of this kind.

intraspace= $\langle base \rangle \langle shrink \rangle \langle stretch \rangle$

Sets the interword space for the writing system of the language, in em units (so, 0 .1 0 is 0em plus .1em). Like `\spaceskip`, the em unit applied is that of the current text (more precisely, the previous glyph). Currently used only in Southeast Asian scripts, like Thai, and CJK.

intrapenalty= $\langle penalty \rangle$

Sets the interword penalty for the writing system of this language. Currently used only in Southeast Asian scripts, like Thai. Ignored if 0 (which is the default value).

NOTE (1) If you need shorthands, you can define them with `\usesshorthands` and `\defineshorthand` as described above. (2) Captions and `\today` are “ensured” with `\babelensure` (this is the default in ini-based languages).

1.17 Digits and counters

New 3.20 About thirty ini files define a field named `digits.native`. When it is present, two macros are created: `\<language>digits` and `\<language>counter` (only xetex and luatex). With the first, a string of ‘Latin’ digits are converted to the native digits of that language; the second takes a counter name as argument. With the option `maparabic` in `\babelprovide`, `\arabic` is redefined to produce the native digits (this is done *globally*, to avoid inconsistencies in, for example, page numbering, and note as well dates do not rely on `\arabic`.)

For example:

```
\babelprovide[import]{telugu} % Telugu better with XeTeX
% Or also, if you want:
% \babelprovide[import, maparabic]{telugu}
\babelfont{rm}{Gautami}
\begin{document}
\telugudigits{1234}
\telugucounter{section}
\end{document}
```

Languages providing native digits in all or some variants are:

Arabic	Persian	Lao	Odia	Urdu
Assamese	Gujarati	Northern Luri	Punjabi	Uzbek
Bangla	Hindi	Malayalam	Pashto	Vai
Tibetar	Khmer	Marathi	Tamil	Cantonese
Bodo	Kannada	Burmese	Telugu	Chinese
Central Kurdish	Konkani	Mazanderani	Thai	
Dzongkha	Kashmiri	Nepali	Uyghur	

New 3.30 With luatex there is an alternative approach for mapping digits, namely, `mapdigits`. Conversion is based on the language and it is applied to the typeset text (not math, PDF bookmarks, etc.) before bidi and fonts are processed (ie, to the node list as generated by the T_EX code). This means the local digits have the correct bidirectional behavior (unlike `Numbers=Arabic` in fontspec, which is not recommended).

New 4.41 Many ‘ini’ locale files has been extended with information about non-positional numerical systems, based on those predefined in CSS. They only work with xetex and luatex and are fully expendable (even inside an `\edef`). Currently, they are limited to numbers below 10000.

There are several ways to use them (for the available styles in each language, see the list below):

- `\localenumeral{<style>}{<number>}`, like `\localenumeral{abjad}{15}`
- `\localecounter{<style>}{<counter>}`, like `\localecounter{lower}{section}`
- In `\babelprovide`, as an argument to the keys `alph` and `Alph`, which redefine what `\alph` and `\Alph` print. For example:

```
\babelprovide[alph=alphabetic]{thai}
```

The styles are:

Ancient Greek `lower.ancient`, `upper.ancient`
Arabic `abjad`, `maghrebi.abjad`
Belarusan, Bulgarian, Macedonian, Serbian `lower`, `upper`
Hebrew `letters` (neither `geresh` nor `gershayim yet`)
Hindi `alphabetic`
Armenian `lower`, `upper`
Japanese `hiragana`, `hiragana.iroha`, `katakana`, `katakana.iroha`, `circled.katakana`, `informal`, `formal`, `cjk-earthly-branch`, `cjk-heavenly-stem`, `fullwidth.lower.alpha`, `fullwidth.upper.alpha`
Georgian `letters`
Greek `lower.modern`, `upper.modern`, `lower.ancient`, `upper.ancient` (all with `keraia`)
Khmer `consonant`
Korean `consonant`, `syllabe`, `hanja.informal`, `hanja.formal`, `hangul.formal`, `cjk-earthly-branch`, `cjk-heavenly-stem`, `fullwidth.lower.alpha`, `fullwidth.upper.alpha`
Persian `abjad`, `alphabetic`
Russian `lower`, `lower.full`, `upper`, `upper.full`
Tamil `ancient`
Thai `alphabetic`
Ukrainian `lower`, `lower.full`, `upper`, `upper.full`
Chinese `cjk-earthly-branch`, `cjk-heavenly-stem`, `fullwidth.lower.alpha`, `fullwidth.upper.alpha`

1.18 Accessing language info

`\language` The control sequence `\language` contains the name of the current language.

WARNING Due to some internal inconsistencies in catcodes, it should *not* be used to test its value. Use `iflang`, by Heiko Oberdiek.

`\iflanguage` $\{\langle language \rangle\}\{\langle true \rangle\}\{\langle false \rangle\}$

If more than one language is used, it might be necessary to know which language is active at a specific time. This can be checked by a call to `\iflanguage`, but note here “language” is used in the \TeX sense, as a set of hyphenation patterns, and *not* as its babel name. This macro takes three arguments. The first argument is the name of a language; the second and third arguments are the actions to take if the result of the test is true or false respectively.

`\localeinfo` $\{\langle field \rangle\}$

New 3.38 If an ini file has been loaded for the current language, you may access the information stored in it. This macros is fully expandable and the available fields are:

`name.english` as provided by the Unicode CLDR.

`tag.ini` is the tag of the ini file (the way this file is identified in its name).

`tag.bcp47` is the BCP 47 language tag.

`tag.opentype` is the tag used by OpenType (usually, but not always, the same as BCP 47).

`script.name` as provided by the Unicode CLDR.

`script.tag.bcp47` is the BCP 47 language tag of the script used by this locale.

`script.tag.opentype` is the tag used by OpenType (usually, but not always, the same as BCP 47).

`\getlocaleproperty` $\{\langle macro \rangle\}\{\langle locale \rangle\}\{\langle property \rangle\}$

New 3.42 The value of any locale property as set by the ini files (or added/modified with `\babelprovide`) can be retrieved and stored in a macro with this command. For example, after:

```
\getlocaleproperty\hechap{hebrew}{captions/chapter}
```

the macro `\hechap` will contain the string פרק.

Babel remembers which ini files have been loaded. There is a loop named

`\LocaleForEach` to traverse the list, where #1 is the name of the current item, so that

`\LocaleForEach{\message{ **#1** }}` just shows the loaded ini's.

NOTE ini files are loaded with `\babelprovide` and also when languages are selected if there is a `\babelfont`. To ensure the ini files are loaded (and therefore the corresponding data) even if these two conditions are not met, write `\BabelEnsureInfo` in the preamble.

1.19 Hyphenation and line breaking

Babel deals with three kinds of line breaking rules: Western, typically the LGC group, South East Asian, like Thai, and CJK, but support depends on the engine: `pdftex` only deals with the former, `xetex` also with the second one, while `luatex` provides basic rules for the latter, too.

`\babelhyphen` $\ast\{\langle type \rangle\}$

`\babelhyphen` $\ast\{\langle text \rangle\}$

New 3.9a It is customary to classify hyphens in two types: (1) *explicit* or *hard hyphens*, which in \TeX are entered as `-`, and (2) *optional* or *soft hyphens*, which are entered as `\-`. Strictly, a *soft hyphen* is not a hyphen, but just a breaking opportunity or, in \TeX terms, a “discretionary”; a *hard hyphen* is a hyphen with a breaking opportunity after it. A further type is a *non-breaking hyphen*, a hyphen without a breaking opportunity.

In \TeX , - and \- forbid further breaking opportunities in the word. This is the desired behavior very often, but not always, and therefore many languages provide shorthands for these cases. Unfortunately, this has not been done consistently: for example, "- in Dutch, Portuguese, Catalan or Danish is a hard hyphen, while in German, Spanish, Norwegian, Slovak or Russian is a soft hyphen. Furthermore, some of them even redefine \-, so that you cannot insert a soft hyphen without breaking opportunities in the rest of the word. Therefore, some macros are provided with a set of basic “hyphens” which can be used by themselves, to define a user shorthand, or even in language files.

- `\babelhyphen{soft}` and `\babelhyphen{hard}` are self explanatory.
- `\babelhyphen{repeat}` inserts a hard hyphen which is repeated at the beginning of the next line, as done in languages like Polish, Portuguese and Spanish.
- `\babelhyphen{nobreak}` inserts a hard hyphen without a break after it (even if a space follows).
- `\babelhyphen{empty}` inserts a break opportunity without a hyphen at all.
- `\babelhyphen{<text>}` is a hard “hyphen” using `<text>` instead. A typical case is `\babelhyphen{/}`.

With all of them, hyphenation in the rest of the word is enabled. If you don’t want to enable it, there is a starred counterpart: `\babelhyphen*{soft}` (which in most cases is equivalent to the original \-), `\babelhyphen*{hard}`, etc.

Note `hard` is also good for isolated prefixes (eg, *anti-*) and `nobreak` for isolated suffixes (eg, *-ism*), but in both cases `\babelhyphen*{nobreak}` is usually better.

There are also some differences with \TeX : (1) the character used is that set for the current font, while in \TeX it is hardwired to - (a typical value); (2) the hyphen to be used in fonts with a negative `\hyphenchar` is -, like in \TeX , but it can be changed to another value by redefining `\babelnullhyphen`; (3) a break after the hyphen is forbidden if preceded by a glue >0 pt (at the beginning of a word, provided it is not immediately preceded by, say, a parenthesis).

`\babelhyphenation` [`<language>` , `<language>` , ...] { `<exceptions>` }

New 3.9a Sets hyphenation exceptions for the languages given or, without the optional argument, for *all* languages (eg, proper nouns or common loan words, and of course monolingual documents). Language exceptions take precedence over global ones. It can be used only in the preamble, and exceptions are set when the language is first selected, thus taking into account changes of `\lccodes`’s done in `\extras<lang>` as well as the language-specific encoding (not set in the preamble by default). Multiple `\babelhyphenation`’s are allowed. For example:

```
\babelhyphenation{Wal-hal-la Dar-bhan-ga}
```

Listed words are saved expanded and therefore it relies on the LICR. Of course, it also works without the LICR if the input and the font encodings are the same, like in Unicode based engines.

NOTE Using `\babelhyphenation` with Southeast Asian scripts is mostly pointless. But with `\babelpatterns` (below) you may fine-tune line breaking (only `luatex`). Even if there are no patterns for the language, you can add at least some typical cases.

\babelpatterns [*<language>* , *<language>* , ...] { *<patterns>* }

New 3.9m In *luatex* only,¹⁵ adds or replaces patterns for the languages given or, without the optional argument, for *all* languages. If a pattern for a certain combination already exists, it gets replaced by the new one.

It can be used only in the preamble, and patterns are added when the language is first selected, thus taking into account changes of `\lccodes`'s done in `\extras<lang>` as well as the language-specific encoding (not set in the preamble by default). Multiple `\babelpatterns`'s are allowed.

Listed patterns are saved expanded and therefore it relies on the LICR. Of course, it also works without the LICR if the input and the font encodings are the same, like in Unicode based engines.

New 3.31 (Only *luatex*.) With `\babelprovide` and imported CJK languages, a simple generic line breaking algorithm (push-out-first) is applied, based on a selection of the Unicode rules (**New 3.32** it is disabled in verbatim mode, or more precisely when the `hyphenrules` are set to `nohyphenation`). It can be activated alternatively by setting explicitly the `intraspace`.

New 3.27 Interword spacing for Thai, Lao and Khemer is activated automatically if a language with one of those scripts are loaded with `\babelprovide`. See the sample on the babel repository. With both Unicode engines, spacing is based on the “current” em unit (the size of the previous char in *luatex*, and the font size set by the last `\selectfont` in *xetex*).

\babelposthyphenation { *<hyphenrules-name>* } { *<lua-pattern>* } { *<replacement>* }

New 3.37-3.39 With *luatex* it is now possible to define non-standard hyphenation rules, like `f-f → ff-f`, repeated hyphens, ranked ruled (or more precisely, ‘penalized’ hyphenation points), and so on. No rules are currently provided by default, but they can be defined as shown in the following example, where `{1}` is the first captured char (between `()` in the pattern):

```
\babelposthyphenation{german}{([fmtrp]) | {1}}
{
  { no = {1}, pre = {1}{1}- }, % Replace first char with disc
  remove,                    % Remove automatic disc (2nd node)
  {}                          % Keep last char, untouched
}
```

In the replacements, a captured char may be mapped to another, too. For example, if the first capture reads `([íú])`, the replacement could be `{1|íú|ú}`, which maps `í` to `í`, and `ú` to `ú`, so that the diaeresis is removed.

This feature is activated with the first `\babelposthyphenation`.

See the babel wiki for a more detailed description and some examples. It also describes an additional replacement type with the key `string`.

EXAMPLE Although the main purpose of this command is non-standard hyphenation, it may actually be used for other transformations (after hyphenation is applied, so you must take discretionaries into account). For example, you can use the `string` replacement to replace a character (or series of them) by another character (or series of them). Thus, to enter `ž` as `zh` and `š` as `sh` in a newly created locale for transliterated Russian:

¹⁵With *luatex* exceptions and patterns can be modified almost freely. However, this is very likely a task for a separate package and *babel* only provides the most basic tools.

```

\babelprovide[hyphenrules=+]{russian-latin} % Create locale
\babelposthyphenation{russian-latin}{([sz])h} % Create rule
{
  { string = {1|sz|šž} },
  remove
}

```

In other words, it is a quite general tool. (A counterpart `\babelprehyphenation` is on the way.)

1.20 Selecting scripts

Currently babel provides no standard interface to select scripts, because they are best selected with either `\fontencoding` (low-level) or a language name (high-level). Even the Latin script may require different encodings (ie, sets of glyphs) depending on the language, and therefore such a switch would be in a sense incomplete.¹⁶

Some languages sharing the same script define macros to switch it (eg, `\textcyrillic`), but be aware they may also set the language to a certain default. Even the babel core defined `\textlatin`, but it was somewhat buggy because in some cases it messed up encodings and fonts (for example, if the main Latin encoding was LY1), and therefore it has been deprecated.¹⁷

`\ensureascii` `{\text}`

New 3.9i This macro makes sure `\text` is typeset with a LICR-savvy encoding in the ASCII range. It is used to redefine `\TeX` and `\LaTeX` so that they are correctly typeset even with LGR or X2 (the complete list is stored in `\BabelNonASCII`, which by default is LGR, X2, OT2, OT3, OT6, LHE, LWN, LMA, LMC, LMS, LMU, but you can modify it). So, in some sense it fixes the bug described in the previous paragraph.

If non-ASCII encodings are not loaded (or no encoding at all), it is no-op (also `\TeX` and `\LaTeX` are not redefined); otherwise, `\ensureascii` switches to the encoding at the beginning of the document if ASCII-savvy, or else the last ASCII-savvy encoding loaded. For example, if you load LY1, LGR, then it is set to LY1, but if you load LY1, T2A it is set to T2A. The symbol encodings TS1, T3, and TS3 are not taken into account, since they are not used for “ordinary” text (they are stored in `\BabelNonText`, used in some special cases when no Latin encoding is explicitly set).

The foregoing rules (which are applied “at begin document”) cover most of the cases. No assumption is made on characters above 127, which may not follow the LICR conventions – the goal is just to ensure most of the ASCII letters and symbols are the right ones.

1.21 Selecting directions

No macros to select the writing direction are provided, either – writing direction is intrinsic to each script and therefore it is best set by the language (which could be a dummy one). Furthermore, there are in fact two right-to-left modes, depending on the language, which differ in the way ‘weak’ numeric characters are ordered (eg, Arabic %123 vs Hebrew 123%).

WARNING The current code for `\text` in `luatex` should be considered essentially stable, but, of course, it is not bug-free and there could be improvements in the future, because

¹⁶The so-called Unicode fonts do not improve the situation either. So, a font suited for Vietnamese is not necessarily suited for, say, the romanization of Indic languages, and the fact it contains glyphs for Modern Greek does not mean it includes them for Classic Greek.

¹⁷But still defined for backwards compatibility.

setting bidi text has many subtleties (see for example <https://www.w3.org/TR/html-bidi/>). A basic stable version for other engines must wait. This applies to text; there is a basic support for **graphical** elements, including the picture environment (with pict2e) and pfg/tikz. Also, indexes and the like are under study, as well as math (there is progress in the latter, too, but for example cases may fail).

An effort is being made to avoid incompatibilities in the future (this one of the reason currently bidi must be explicitly requested as a package option, with a certain bidi model, and also the layout options described below).

WARNING If characters to be mirrored are shown without changes with luatex, try with the following line:

```
\babeladjust{bidi.mirroring=off}
```

There are some package options controlling bidi writing.

bidi= default | basic | basic-r | bidi-l | bidi-r

New 3.14 Selects the bidi algorithm to be used. With default the bidi mechanism is just activated (by default it is not), but every change must be marked up. In xetex and pdftex this is the only option.

In luatex, basic-r provides a simple and fast method for R text, which handles numbers and unmarked L text within an R context many in typical cases. **New 3.19** Finally, basic supports both L and R text, and it is the preferred method (support for basic-r is currently limited). (They are named basic mainly because they only consider the intrinsic direction of scripts and weak directionality.)

New 3.29 In xetex, bidi-r and bidi-l resort to the package bidi (by Vafa Khalighi). Integration is still somewhat tentative, but it mostly works. For RL documents use the former, and for LR ones use the latter.

There are samples on GitHub, under /required/babel/samples. See particularly lua-bidibasic.tex and lua-secenum.tex.

EXAMPLE The following text comes from the Arabic Wikipedia (article about Arabia). Copy-pasting some text from the Wikipedia is a good way to test this feature. Remember basic is available in luatex only.

```
\documentclass{article}

\usepackage[bidi=basic]{babel}

\babelprovide[import, main]{arabic}

\babelfont{rm}{FreeSerif}

\begin{document}

    وقد عرفت شبه جزيرة العرب طيلة العصر الهيليني (الاجريقي) بـ
    Arabia أو Aravia (بالاغريقية Ἀραβία)، استخدم الرومان ثلاث
    بادئات بـ“Arabia” على ثلاث مناطق من شبه الجزيرة العربية، إلا أنها
    حقيقةً كانت أكبر مما تعرف عليه اليوم.

\end{document}
```

EXAMPLE With `bidi=basic` both L and R text can be mixed without explicit markup (the latter will be only necessary in some special cases where the Unicode algorithm fails). It is used much like `bidi=basic-r`, but with R text inside L text you may want to map the font so that the correct features are in force. This is accomplished with an option in `\babelprovide`, as illustrated:

```
\documentclass{book}

\usepackage[english, bidi=basic]{babel}

\babelprovide[onchar=ids fonts]{arabic}

\babelfont{rm}{Crimson}
\babelfont[*arabic]{rm}{FreeSerif}

\begin{document}

Most Arabic speakers consider the two varieties to be two registers
of one language, although the two registers can be referred to in
Arabic as \textit{فصحى العصر} \textit{fuṣḥā l-‘aṣr} (MSA) and
\textit{فصحى التراث} \textit{fuṣḥā t-turāth} (CA).

\end{document}
```

In this example, and thanks to `onchar=ids fonts`, any Arabic letter (because the language is arabic) changes its font to that set for this language (here defined via `*arabic`, because Crimson does not provide Arabic letters).

NOTE Boxes are “black boxes”. Numbers inside an `\hbox` (for example in a `\ref`) do not know anything about the surrounding chars. So, `\ref{A}-\ref{B}` are not rendered in the visual order A-B, but in the wrong one B-A (because the hyphen does not “see” the digits inside the `\hbox`’es). If you need `\ref` ranges, the best option is to define a dedicated macro like this (to avoid explicit direction changes in the body; here `\texthe` must be defined to select the main language):

```
\newcommand\refrange[2]{\babelsublr{\texthe{\ref{#1}}-\texthe{\ref{#2}}}}
```

In the future a more complete method, reading recursively boxed text, may be added.

layout= sectioning | counters | lists | contents | footnotes | captions | columns | graphics | extras

New 3.16 *To be expanded.* Selects which layout elements are adapted in bidi documents, including some text elements (except with options loading the `bidi` package, which provides its own mechanism to control these elements). You may use several options with a dot-separated list (eg, `layout=counters.contents.sectioning`). This list will be expanded in future releases. Note not all options are required by all engines.

sectioning makes sure the sectioning macros are typeset in the main language, but with the title text in the current language (see below `\BabelPatchSection` for further details).

counters required in all engines (except `luatex` with `bidi=basic`) to reorder section numbers and the like (eg, `\subsection{.section}`); required in `xetex` and `pdftex` for counters in general, as well as in `luatex` with `bidi=default`; required in `luatex` for

numeric footnote marks >9 with `bidi=basic-r` (but *not* with `bidi=basic`); note, however, it could depend on the counter format.

With counters, `\arabic` is not only considered L text always (with `\babelsublr`, see below), but also an “isolated” block which does not interact with the surrounding chars. So, while 1.2 in R text is rendered in that order with `bidi=basic` (as a decimal number), in `\arabic{c1}.\arabic{c2}` the visual order is `c2.c1`. Of course, you may always adjust the order by changing the language, if necessary.¹⁸

lists required in xetex and pdftex, but only in bidirectional (with both R and L paragraphs) documents in luatex.

WARNING As of April 2019 there is a bug with `\par shape` in luatex (a \TeX primitive) which makes lists to be horizontally misplaced if they are inside a `\vbox` (like `minipage`) and the current direction is different from the main one. A workaround is to restore the main language before the box and then set the local one inside.

contents required in xetex and pdftex; in luatex toc entries are R by default if the main language is R.

columns required in xetex and pdftex to reverse the column order (currently only the standard two-column mode); in luatex they are R by default if the main language is R (including `multicol`).

footnotes not required in monolingual documents, but it may be useful in bidirectional documents (with both R and L paragraphs) in all engines; you may use alternatively `\BabelFootnote` described below (what this option does exactly is also explained there).

captions is similar to sectioning, but for `\caption`; not required in monolingual documents with luatex, but may be required in xetex and pdftex in some styles (support for the latter two engines is still experimental) **New 3.18** .

tabular required in luatex for R `tabular` (it has been tested only with simple tables, so expect some readjustments in the future); ignored in pdftex or xetex (which will not support a similar option in the short term). It patches an internal command, so it might be ignored by some packages and classes (or even raise an error). **New 3.18** .

graphics modifies the `picture` environment so that the whole figure is L but the text is R. It *does not* work with the standard `picture`, and `pict2e` is required if you want sloped lines. It attempts to do the same for `pgf/tikz`. Somewhat experimental. **New 3.32** .

extras is used for miscellaneous readjustments which do not fit into the previous groups. Currently redefines in luatex `\underline` and `\LaTeXe` **New 3.19** .

EXAMPLE Typically, in an Arabic document you would need:

```
\usepackage[bidi=basic,
             layout=counters.tabular]{babel}
```

\babelsublr `{\lr-text}`

Digits in pdftex must be marked up explicitly (unlike luatex with `bidi=basic` or `bidi=basic-r` and, usually, xetex). This command is provided to set `{\lr-text}` in L mode if necessary. It's intended for what Unicode calls weak characters, because words are best set with the corresponding language. For this reason, there is no `r1` counterpart. Any `\babelsublr` in *explicit* L mode is ignored. However, with `bidi=basic` and *implicit* L, it first returns to R and then switches to explicit L. To clarify this point, consider, in an R context:

¹⁸Next on the roadmap are counters and numeral systems in general. Expect some minor readjustments.

```
RTL A ltr text \thechapter{} and still ltr RTL B
```

There are *three* R blocks and *two* L blocks, and the order is *RTL B and still ltr 1 ltr text RTL A*. This is by design to provide the proper behavior in the most usual cases — but if you need to use `\ref` in an L text inside R, the L text must be marked up explicitly; for example:

```
RTL A \foreignlanguage{english}{ltr text \thechapter{} and still ltr} RTL B
```

`\BabelPatchSection` `{<section-name>}`

Mainly for bidi text, but it could be useful in other cases. `\BabelPatchSection` and the corresponding option `layout=sectioning` takes a more logical approach (at least in many cases) because it applies the global language to the section format (including the `\chaptername` in `\chapter`), while the section text is still the current language. The latter is passed to tocs and marks, too, and with `sectioning` in `layout` they both reset the “global” language to the main one, while the text uses the “local” language. With `layout=sectioning` all the standard sectioning commands are redefined (it also “isolates” the page number in heads, for a proper bidi behavior), but with this command you can set them individually if necessary (but note then tocs and marks are not touched).

`\BabelFootnote` `{<cmd>}{<local-language>}{<before>}{<after>}`

New 3.17 Something like:

```
\BabelFootnote{\parsfootnote}{\language}\{()\}
```

defines `\parsfootnote` so that `\parsfootnote{note}` is equivalent to:

```
\footnote{(\foreignlanguage{\language}{note})}
```

but the footnote itself is typeset in the main language (to unify its direction). In addition, `\parsfootnotetext` is defined. The option `footnotes` just does the following:

```
\BabelFootnote{\footnote}{\language}\{()\}%  
\BabelFootnote{\localfootnote}{\language}\{()\}%  
\BabelFootnote{\mainfootnote}\{()\}
```

(which also redefine `\footnotetext` and define `\localfootnotetext` and `\mainfootnotetext`). If the language argument is empty, then no language is selected inside the argument of the footnote. Note this command is available always in bidi documents, even without `layout=footnotes`.

EXAMPLE If you want to preserve directionality in footnotes and there are many footnotes entirely in English, you can define:

```
\BabelFootnote{\enfootnote}{english}\{.}
```

It adds a period outside the English part, so that it is placed at the left in the last line. This means the dot the end of the footnote text should be omitted.

1.22 Language attributes

`\languageattribute`

This is a user-level command, to be used in the preamble of a document (after `\usepackage[...]{babel}`), that declares which attributes are to be used for a given language. It takes two arguments: the first is the name of the language; the second, a (list of) attribute(s) to be used. Attributes must be set in the preamble and only once – they cannot be turned on and off. The command checks whether the language is known in this document and whether the attribute(s) are known for this language.

Very often, using a *modifier* in a package option is better.

Several language definition files use their own methods to set options. For example, french uses `\frenchsetup`, magyar (1.5) uses `\magyarOptions`; modifiers provided by spanish have no attribute counterparts. Macros setting options are also used (eg, `\ProsodicMarksOn` in latin).

1.23 Hooks

New 3.9a A hook is a piece of code to be executed at certain events. Some hooks are predefined when `luatex` and `xetex` are used.

`\AddBabelHook` [`<lang>`]{`<name>`}{`<event>`}{`<code>`}

The same name can be applied to several events. Hooks may be enabled and disabled for all defined events with `\EnableBabelHook{<name>}`, `\DisableBabelHook{<name>}`.

Names containing the string `babel` are reserved (they are used, for example, by `\useshortands*` to add a hook for the event `afterextras`). **New 3.33** They may be also applied to a specific language with the optional argument; language-specific settings are executed after global ones.

Current events are the following; in some of them you can use one to three `TEX` parameters (`#1`, `#2`, `#3`), with the meaning given:

adddialect (language name, dialect name) Used by `luababel.def` to load the patterns if not preloaded.

patterns (language name, language with encoding) Executed just after the `\language` has been set. The second argument has the patterns name actually selected (in the form of either `lang:ENC` or `lang`).

hyphenation (language name, language with encoding) Executed locally just before exceptions given in `\babelhyphenation` are actually set.

defaultcommands Used (locally) in `\StartBabelCommands`.

encodedcommands (input, font encodings) Used (locally) in `\StartBabelCommands`. Both `xetex` and `luatex` make sure the encoded text is read correctly.

stopcommands Used to reset the above, if necessary.

write This event comes just after the switching commands are written to the aux file.

beforeextras Just before executing `\extras<language>`. This event and the next one should not contain language-dependent code (for that, add it to `\extras<language>`).

afterextras Just after executing `\extras<language>`. For example, the following deactivates shorthands in all languages:

```
\AddBabelHook{noshort}{afterextras}{\languageshorthands{none}}
```

stringprocess Instead of a parameter, you can manipulate the macro `\BabelString` containing the string to be defined with `\SetString`. For example, to use an expanded version of the string in the definition, write:

```
\AddBabelHook{myhook}{stringprocess}{%
\protected@edef\BabelString{\BabelString}}
```

initiateactive (char as active, char as other, original char) **New 3.9i** Executed just after a shorthand has been ‘initiated’. The three parameters are the same character with different catcodes: active, other (`\string’ed`) and the original one.

afterreset **New 3.9i** Executed when selecting a language just after `\originalTeX` is run and reset to its base value, before executing `\captions⟨language⟩` and `\date⟨language⟩`.

Four events are used in `hyphen.cfg`, which are handled in a quite different way for efficiency reasons – unlike the precedent ones, they only have a single hook and replace a default definition.

everylanguage (language) Executed before every language patterns are loaded.

loadkernel (file) By default just defines a few basic commands. It can be used to define different versions of them or to load a file.

loadpatterns (patterns file) Loads the patterns file. Used by `luababel.def`.

loadexceptions (exceptions file) Loads the exceptions file. Used by `luababel.def`.

\BabelContentsFiles **New 3.9a** This macro contains a list of “toc” types requiring a command to switch the language. Its default value is `toc,lof,lot`, but you may redefine it with `\renewcommand` (it’s up to you to make sure no toc type is duplicated).

1.24 Languages supported by babel with ldf files

In the following table most of the languages supported by babel with and .ldf file are listed, together with the names of the option which you can load babel with for each language. Note this list is open and the current options may be different. It does not include ini files.

Afrikaans afrikaans

Azerbaijani azerbaijani

Basque basque

Breton breton

Bulgarian bulgarian

Catalan catalan

Croatian croatian

Czech czech

Danish danish

Dutch dutch

English english, USenglish, american, UKenglish, british, canadian, australian, newzealand

Esperanto esperanto

Estonian estonian

Finnish finnish

French french, francais, canadien, acadian

Galician galician

German austrian, german, germanb, ngerman, naustrian

Greek greek, polutonikogreek

Hebrew hebrew

Icelandic icelandic

Indonesian indonesian, bahasa, indon, bahasai

Interlingua interlingua

Irish Gaelic irish
Italian italian
Latin latin
Lower Sorbian lowersorbian
Malay malay, melayu, bahasam
North Sami samin
Norwegian norsk, nynorsk
Polish polish
Portuguese portuguese, portuges¹⁹, brazilian, brazil
Romanian romanian
Russian russian
Scottish Gaelic scottish
Spanish spanish
Slovakian slovak
Slovenian slovene
Swedish swedish
Serbian serbian
Turkish turkish
Ukrainian ukrainian
Upper Sorbian uppsorbian
Welsh welsh

There are more languages not listed above, including hindi, thai, thaicjk, latvian, turkmen, magyar, mongolian, romansh, lithuanian, spanglish, vietnamese, japanese, pinyin, arabic, farsi, ibygreek, bgreek, serbianc, frenchle, ethiop and friulan.

Most of them work out of the box, but some may require extra fonts, encoding files, a preprocessor or even a complete framework (like CJK or luatexja). For example, if you have got the velthuis/devnag package, you can create a file with extension .dn:

```

\documentclass{article}
\usepackage[hindi]{babel}
\begin{document}
{\dn devaanaa.m priya.h}
\end{document}

```

Then you preprocess it with devnag $\langle file \rangle$, which creates $\langle file \rangle$.tex; you can then typeset the latter with \LaTeX .

1.25 Unicode character properties in luatex

New 3.32 Part of the babel job is to apply Unicode rules to some script-specific features based on some properties. Currently, they are 3, namely, direction (ie, bidi class), mirroring glyphs, and line breaking for CJK scripts. These properties are stored in lua tables, which you can modify with the following macro (for example, to set them for glyphs in the PUA).

$\backslash\text{babelcharproperty}$ $\{ \langle char-code \rangle \} [\langle to-char-code \rangle] \{ \langle property \rangle \} \{ \langle value \rangle \}$

New 3.32 Here, $\{ \langle char-code \rangle \}$ is a number (with \TeX syntax). With the optional argument, you can set a range of values. There are three properties (with a short name, taken from Unicode): direction (bc), mirror (bmg), linebreak (lb). The settings are global, and this command is allowed only in vertical mode (the preamble or between paragraphs). For example:

¹⁹This name comes from the times when they had to be shortened to 8 characters

```
\babelcharproperty{`{}}{mirror}{`?}
\babelcharproperty{`-}{direction}{l} % or al, r, en, an, on, et, cs
\babelcharproperty{`}{linebreak}{cl} % or id, op, cl, ns, ex, in, hy
```

New 3.39 Another property is `locale`, which adds characters to the list used by `onchar` in `\babelprovide`, or, if the last argument is empty, removes them. The last argument is the locale name:

```
\babelcharproperty{`,`}{locale}{english}
```

1.26 Tweaking some features

`\babeladjust` $\langle\textit{key-value-list}\rangle$

New 3.36 Sometimes you might need to disable some babel features. Currently this macro understands the following keys (and only for `luatex`), with values on or off: `bidirectional`, `bidirectional.mirroring`, `bidirectional.mapdigits`, `layout.lists`, `layout.tabular`, `linebreak.sea`, `linebreak.cjk`. For example, you can set `\babeladjust{bidirectional.text=off}` if you are using an alternative algorithm or with large sections not requiring it. With `luaHTeX` you may need `bidirectional.mirroring=off`. Use with care, because these options do not deactivate other related options (like paragraph direction with `bidirectional`).

1.27 Tips, workarounds, known issues and notes

- If you use the document class *book* and you use `\ref` inside the argument of `\chapter` (or just use `\ref` inside `\MakeUppercase`), \TeX will keep complaining about an undefined label. To prevent such problems, you could revert to using uppercase labels, you can use `\lowercase{\ref{foo}}` inside the argument of `\chapter`, or, if you will not use shorthands in labels, set the `safe` option to `none` or `bib`.
- Both `lATEX` and `babel` use `\AtBeginDocument` to change some catcodes, and `babel` reloads `hline` to make sure `:` has the right one, so if you want to change the catcode of `|` it has to be done using the same method at the proper place, with

```
\AtBeginDocument{\DeleteShortVerb{\|}}
```

before loading `babel`. This way, when the document begins the sequence is (1) make `|` active (`lATEX`); (2) make it unactive (your settings); (3) make `babel` shorthands active (`babel`); (4) reload `hline` (`babel`, now with the correct catcodes for `|` and `:`).

- Documents with several input encodings are not frequent, but sometimes are useful. You can set different encodings for different languages as the following example shows:

```
\addto\extrasfrench{\inputencoding{latin1}}
\addto\extrarussian{\inputencoding{koi8-r}}
```

(A recent version of `inputenc` is required.)

- For the hyphenation to work correctly, `lccodes` cannot change, because \TeX only takes into account the values when the paragraph is hyphenated, i.e., when it has been

finished.²⁰ So, if you write a chunk of French text with `\foreignlanguage`, the apostrophes might not be taken into account. This is a limitation of \TeX , not of babel. Alternatively, you may use `\usesorthands` to activate ' and `\definesorthand`, or redefine `\textquoteright` (the latter is called by the non-ASCII right quote).

- `\bibitem` is out of sync with `\selectlanguage` in the `.aux` file. The reason is `\bibitem` uses `\immediate` (and others, in fact), while `\selectlanguage` doesn't. There is no known workaround.
- Babel does not take into account `\normalsfcodes` and (non-)French spacing is not always properly (un)set by languages. However, problems are unlikely to happen and therefore this part remains untouched in version 3.9 (but it is in the 'to do' list).
- Using a character mathematically active (ie, with math code "8000) as a shorthand can make \TeX enter in an infinite loop in some rare cases. (Another issue in the 'to do' list, although there is a partial solution.)

The following packages can be useful, too (the list is still far from complete):

csquotes Logical markup for quotes.

iflang Tests correctly the current language.

hyphsubst Selects a different set of patterns for a language.

translator An open platform for packages that need to be localized.

siunitx Typesetting of numbers and physical quantities.

biblatex Programmable bibliographies and citations.

bicaption Bilingual captions.

babelbib Multilingual bibliographies.

microtype Adjusts the typesetting according to some languages (kerning and spacing).

Ligatures can be disabled.

substitutefont Combines fonts in several encodings.

mkpattern Generates hyphenation patterns.

tracklang Tracks which languages have been requested.

ucharclasses (xetex) Switches fonts when you switch from one Unicode block to another.

zhspacing Spacing for CJK documents in xetex.

1.28 Current and future work

The current work is focused on the so-called complex scripts in luatex. In 8-bit engines, babel provided a basic support for bidi text as part of the style for Hebrew, but it is somewhat unsatisfactory and internally replaces some hardwired commands by other hardwired commands (generic changes would be much better).

Useful additions would be, for example, time, currency, addresses and personal names.²¹ But that is the easy part, because they don't require modifying the \LaTeX internals.

Calendars (Arabic, Persian, Indic, etc.) are under study.

Also interesting are differences in the sentence structure or related to it. For example, in Basque the number precedes the name (including chapters), in Hungarian "from (1)" is "(1)-ből", but "from (3)" is "(3)-ből", in Spanish an item labelled "3.^o" may be referred to as either "ítem 3.^o" or "3.^{er} ítem", and so on.

An option to manage bidirectional document layout in luatex (lists, footnotes, etc.) is almost finished, but xetex required more work. Unfortunately, proper support for xetex requires patching somehow lots of macros and packages (and some issues related to

²⁰This explains why \LaTeX assumes the lowercase mapping of T1 and does not provide a tool for multiple mappings. Unfortunately, `\savingsphcodes` is not a solution either, because `lccodes` for hyphenation are frozen in the format and cannot be changed.

²¹See for example POSIX, ISO 14652 and the Unicode Common Locale Data Repository (CLDR). Those systems, however, have limited application to \TeX because their aim is just to display information and not fine typesetting.

`\specials` remain, like color and hyperlinks), so babel resorts to the bidi package (by Vafa Khalighi). See the babel repository for a small example (`xe-bidi`).

1.29 Tentative and experimental code

See the code section for `\foreignlanguage*` (a new starred version of `\foreignlanguage`).

Old and deprecated stuff

A couple of tentative macros were provided by babel ($\geq 3.9g$) with a partial solution for “Unicode” fonts. These macros are now deprecated — use `\babelfont`. A short description follows, for reference:

- `\babelFSstore{\langle babel-language \rangle}` sets the current three basic families (rm, sf, tt) as the default for the language given.
- `\babelFSdefault{\langle babel-language \rangle}{\langle fontspec-features \rangle}` patches `\fontspec` so that the given features are always passed as the optional argument or added to it (not an ideal solution).

So, for example:

```
\setmainfont[Language=Turkish]{Minion Pro}
\babelFSstore{turkish}
\setmainfont{Minion Pro}
\babelFSfeatures{turkish}{Language=Turkish}
```

2 Loading languages with `language.dat`

\TeX and most engines based on it (`pdf \TeX` , `xetex`, ϵ - \TeX , the main exception being `luatex`) require hyphenation patterns to be preloaded when a format is created (eg, \LaTeX , \XeLaTeX , `pdf \LaTeX`). babel provides a tool which has become standard in many distributions and based on a “configuration file” named `language.dat`. The exact way this file is used depends on the distribution, so please, read the documentation for the latter (note also some distributions generate the file with some tool).

New 3.9q With `luatex`, however, patterns are loaded on the fly when requested by the language (except the “0th” language, typically english, which is preloaded always).²² Until 3.9n, this task was delegated to the package `luatex-hyphen`, by Khaled Hosny, Élie Roux, and Manuel Pégourié-Gonnard, and required an extra file named `language.dat.lua`, but now a new mechanism has been devised based solely on `language.dat`. **You must rebuild the formats** if upgrading from a previous version. You may want to have a local `language.dat` for a particular project (for example, a book on Chemistry).²³

2.1 Format

In that file the person who maintains a \TeX environment has to record for which languages he has hyphenation patterns *and* in which files these are stored²⁴. When hyphenation exceptions are stored in a separate file this can be indicated by naming that file *after* the file with the hyphenation patterns.

The file can contain empty lines and comments, as well as lines which start with an equals (=) sign. Such a line will instruct \LaTeX that the hyphenation patterns just processed have to be known under an alternative name. Here is an example:

²²This feature was added to 3.9o, but it was buggy. Both 3.9o and 3.9p are deprecated.

²³The loader for `lua(e)tex` is slightly different as it's not based on babel but on `etex.src`. Until 3.9p it just didn't work, but thanks to the new code it works by reloading the data in the babel way, i.e., with `language.dat`.

²⁴This is because different operating systems sometimes use very different file-naming conventions.

```
% File      : language.dat
% Purpose   : tell iniTeX what files with patterns to load.
english     english.hyphenations
=british

dutch       hyphen.dutch exceptions.dutch % Nederlands
german      hyphen.ger
```

You may also set the font encoding the patterns are intended for by following the language name by a colon and the encoding code.²⁵ For example:

```
german:T1 hyphenT1.ger
german hyphen.ger
```

With the previous settings, if the encoding when the language is selected is T1 then the patterns in `hyphenT1.ger` are used, but otherwise use those in `hyphen.ger` (note the encoding could be set in `\extras⟨lang⟩`).

A typical error when using `babel` is the following:

```
No hyphenation patterns were preloaded for
the language `⟨lang⟩' into the format.
Please, configure your TeX system to add them and
rebuild the format. Now I will use the patterns
preloaded for english instead}}
```

It simply means you must reconfigure `language.dat`, either by hand or with the tools provided by your distribution.

3 The interface between the core of `babel` and the language definition files

The *language definition files* (`ldf`) must conform to a number of conventions, because these files have to fill in the gaps left by the common code in `babel.def`, i.e., the definitions of the macros that produce texts. Also the language-switching possibility which has been built into the `babel` system has its implications.

The following assumptions are made:

- Some of the language-specific definitions might be used by plain $\text{T}_{\text{E}}\text{X}$ users, so the files have to be coded so that they can be read by both \LaTeX and plain $\text{T}_{\text{E}}\text{X}$. The current format can be checked by looking at the value of the macro `\fmtname`.
- The common part of the `babel` system redefines a number of macros and environments (defined previously in the document style) to put in the names of macros that replace the previously hard-wired texts. These macros have to be defined in the language definition files.
- The language definition files must define five macros, used to activate and deactivate the language-specific definitions. These macros are `\⟨lang⟩hyphenmins`, `\captions⟨lang⟩`, `\date⟨lang⟩`, `\extras⟨lang⟩` and `\noextras⟨lang⟩` (the last two may be left empty); where `⟨lang⟩` is either the name of the language definition file or the name of the \LaTeX option that is to be used. These macros and their functions are

²⁵This is not a new feature, but in former versions it didn't work correctly.

discussed below. You must define all or none for a language (or a dialect); defining, say, `\date⟨lang⟩` but not `\captions⟨lang⟩` does not raise an error but can lead to unexpected results.

- When a language definition file is loaded, it can define `\l@⟨lang⟩` to be a dialect of `\language0` when `\l@⟨lang⟩` is undefined.
- Language names must be all lowercase. If an unknown language is selected, babel will attempt setting it after lowercasing its name.
- The semantics of modifiers is not defined (on purpose). In most cases, they will just be simple separated options (eg, spanish), but a language might require, say, a set of options organized as a tree with suboptions (in such a case, the recommended separator is `/`).

Some recommendations:

- The preferred shorthand is `"`, which is not used in \LaTeX (quotes are entered as ``` and `'`). Other good choices are characters which are not used in a certain context (eg, `=` in an ancient language). Note however `=`, `<`, `>`, `:` and the like can be dangerous, because they may be used as part of the syntax of some elements (numeric expressions, key/value pairs, etc.).
- Captions should not contain shorthands or encoding-dependent commands (the latter is not always possible, but should be clearly documented). They should be defined using the LICR. You may also use the new tools for encoded strings, described below.
- Avoid adding things to `\noextras⟨lang⟩` except for `umlauthigh` and friends, `\bbl@deactivate`, `\bbl@(non)frenchspacing`, and language-specific macros. Use always, if possible, `\bbl@save` and `\bbl@savevariable` (except if you still want to have access to the previous value). Do not reset a macro or a setting to a hardcoded value. Never. Instead save its value in `\extras⟨lang⟩`.
- Do not switch scripts. If you want to make sure a set of glyphs is used, switch either the font encoding (low-level) or the language (high-level, which in turn may switch the font encoding). Usage of things like `\latintext` is deprecated.²⁶
- Please, for “private” internal macros do not use the `\bbl@` prefix. It is used by babel and it can lead to incompatibilities.

There are no special requirements for documenting your language files. Now they are not included in the base babel manual, so provide a standalone document suited for your needs, as well as other files you think can be useful. A PDF and a “readme” are strongly recommended.

3.1 Guidelines for contributed languages

Now language files are “outsourced” and are located in a separate directory (`/macros/latex/contrib/babel-contrib`), so that they are contributed directly to CTAN (please, do not send to me language styles just to upload them to CTAN). Of course, placing your style files in this directory is not mandatory, but if you want to do it, here are a few guidelines.

- Do not hesitate stating on the file heads you are the author and the maintainer, if you actually are. There is no need to state the babel maintainer(s) as authors if they have not contributed significantly to your language files.

²⁶But not removed, for backward compatibility.

- Fonts are not strictly part of a language, so they are best placed in the corresponding TeX tree. This includes not only `tfm`, `vf`, `ps1`, `otf`, `mf` files and the like, but also `fd` ones.
- Font and input encodings are usually best placed in the corresponding tree, too, but sometimes they belong more naturally to the babel style. Note you may also need to define a LICR.
- Babel `ldf` files may just interface a framework, as it happens often with Oriental languages/scripts. This framework is best placed in its own directory.

The following page provides a starting point: <http://www.texnia.com/incubator.html>. If you need further assistance and technical advice in the development of language styles, I am willing to help you. And of course, you can make any suggestion you like.

3.2 Basic macros

In the core of the babel system, several macros are defined for use in language definition files. Their purpose is to make a new language known. The first two are related to hyphenation patterns.

`\addlanguage` The macro `\addlanguage` is a non-outer version of the macro `\newlanguage`, defined in `plain.tex` version 3.x. For older versions of `plain.tex` and `lplain.tex` a substitute definition is used. Here “language” is used in the TeX sense of set of hyphenation patterns.

`\adddialect` The macro `\adddialect` can be used when two languages can (or must) use the same hyphenation patterns. This can also be useful for languages for which no patterns are preloaded in the format. In such cases the default behavior of the babel system is to define this language as a ‘dialect’ of the language for which the patterns were loaded as `\language0`. Here “language” is used in the TeX sense of set of hyphenation patterns.

`\<lang>hyphenmins` The macro `\<lang>hyphenmins` is used to store the values of the `\lefthyphenmin` and `\righthyphenmin`. Redefine this macro to set your own values, with two numbers corresponding to these two parameters. For example:

```
\renewcommand\spanishhyphenmins{34}
```

(Assigning `\lefthyphenmin` and `\righthyphenmin` directly in `\extras<lang>` has no effect.)

`\providehyphenmins` The macro `\providehyphenmins` should be used in the language definition files to set `\lefthyphenmin` and `\righthyphenmin`. This macro will check whether these parameters were provided by the hyphenation file before it takes any action. If these values have been already set, this command is ignored (currently, default pattern files do *not* set them).

`\captions<lang>` The macro `\captions<lang>` defines the macros that hold the texts to replace the original hard-wired texts.

`\date<lang>` The macro `\date<lang>` defines `\today`.

`\extras<lang>` The macro `\extras<lang>` contains all the extra definitions needed for a specific language. This macro, like the following, is a hook – you can add things to it, but it must not be used directly.

`\noextras<lang>` Because we want to let the user switch between languages, but we do not know what state TeX might be in after the execution of `\extras<lang>`, a macro that brings TeX into a predefined state is needed. It will be no surprise that the name of this macro is `\noextras<lang>`.

`\bbl@declare@ttribute` This is a command to be used in the language definition files for declaring a language attribute. It takes three arguments: the name of the language, the attribute to be defined, and the code to be executed when the attribute is to be used.

`\main@language` To postpone the activation of the definitions needed for a language until the beginning of a document, all language definition files should use `\main@language` instead of

	<code>\selectlanguage</code> . This will just store the name of the language, and the proper language will be activated at the start of the document.
<code>\ProvidesLanguage</code>	The macro <code>\ProvidesLanguage</code> should be used to identify the language definition files. Its syntax is similar to the syntax of the \TeX command <code>\ProvidesPackage</code> .
<code>\LdfInit</code>	The macro <code>\LdfInit</code> performs a couple of standard checks that must be made at the beginning of a language definition file, such as checking the category code of the <code>@</code> -sign, preventing the <code>.ldf</code> file from being processed twice, etc.
<code>\ldf@quit</code>	The macro <code>\ldf@quit</code> does work needed if a <code>.ldf</code> file was processed earlier. This includes resetting the category code of the <code>@</code> -sign, preparing the language to be activated at <code>\begin{document}</code> time, and ending the input stream.
<code>\ldf@finish</code>	The macro <code>\ldf@finish</code> does work needed at the end of each <code>.ldf</code> file. This includes resetting the category code of the <code>@</code> -sign, loading a local configuration file, and preparing the language to be activated at <code>\begin{document}</code> time.
<code>\loadlocalcfg</code>	After processing a language definition file, \TeX can be instructed to load a local configuration file. This file can, for instance, be used to add strings to <code>\captions{lang}</code> to support local document classes. The user will be informed that this configuration file has been loaded. This macro is called by <code>\ldf@finish</code> .
<code>\substitutefontfamily</code>	(Deprecated.) This command takes three arguments, a font encoding and two font family names. It creates a font description file for the first font in the given encoding. This <code>.fd</code> file will instruct \TeX to use a font from the second family when a font from the first family in the given encoding seems to be needed.

3.3 Skeleton

Here is the basic structure of an `ldf` file, with a language, a dialect and an attribute. Strings are best defined using the method explained in sec. 3.8 (babel 3.9 and later).

```

\ProvidesLanguage{<language>}
  [2016/04/23 v0.0 <Language> support from the babel system]
\LdfInit{<language>}{captions<language>}

\ifx\undefined\l@<language>
  \@nopatterns{<Language>}
  \adddialect\l@<language>0
\fi

\adddialect\l@<dialect>\l@<language>

\bbl@declare@ttribute{<language>}{<attrib>}{%
  \expandafter\addto\expandafter\extras<language>
  \expandafter{\extras<attrib><language>}%
  \let\captions<language>\captions<attrib><language>}

\providehyphenmins{<language>}{\tw@\thr@@}

\StartBabelCommands*{<language>}{captions}
\SetString\chaptername{<chapter name>}
% More strings

\StartBabelCommands*{<language>}{date}
\SetString\monthname{<name of first month>}
% More strings

\StartBabelCommands*{<dialect>}{captions}
\SetString\chaptername{<chapter name>}

```

```

% More strings

\StartBabelCommands*{<dialect>}{date}
\SetString\monthinname{<name of first month>}
% More strings

\EndBabelCommands

\addto\extras<language>{}
\addto\noextras<language>{}
\let\extras<dialect>\extras<language>
\let\noextras<dialect>\noextras<language>

\ldf@finish{<language>}

```

NOTE If for some reason you want to load a package in your style, you should be aware it cannot be done directly in the ldf file, but it can be delayed with `\AtEndOfPackage`. Macros from external packages can be used *inside* definitions in the ldf itself (for example, `\extras<language>`), but if executed directly, the code must be placed inside `\AtEndOfPackage`. A trivial example illustrating these points is:

```

\AtEndOfPackage{%
  \RequirePackage{dingbat}%      Delay package
  \savebox{\myeye}{\eye}}%      And direct usage
\newsavebox{\myeye}
\newcommand\myanchor{\anchor}%  But OK inside command

```

3.4 Support for active characters

In quite a number of language definition files, active characters are introduced. To facilitate this, some support macros are provided.

<code>\initiate@active@char</code>	<p>The internal macro <code>\initiate@active@char</code> is used in language definition files to instruct \TeX to give a character the category code ‘active’. When a character has been made active it will remain that way until the end of the document. Its definition may vary.</p>
<code>\bbl@activate</code> <code>\bbl@deactivate</code>	<p>The command <code>\bbl@activate</code> is used to change the way an active character expands. <code>\bbl@activate</code> ‘switches on’ the active behavior of the character. <code>\bbl@deactivate</code> lets the active character expand to its former (mostly) non-active self.</p>
<code>\declare@shorthand</code>	<p>The macro <code>\declare@shorthand</code> is used to define the various shorthands. It takes three arguments: the name for the collection of shorthands this definition belongs to; the character (sequence) that makes up the shorthand, i.e. <code>~</code> or <code>"a</code>; and the code to be executed when the shorthand is encountered. (It does <i>not</i> raise an error if the shorthand character has not been “initiated”.)</p>
<code>\bbl@add@special</code> <code>\bbl@remove@special</code>	<p>The \TeXbook states: “Plain \TeX includes a macro called <code>\dospecials</code> that is essentially a set macro, representing the set of all characters that have a special category code.” [4, p. 380] It is used to set text ‘verbatim’. To make this work if more characters get a special category code, you have to add this character to the macro <code>\dospecial</code>. \TeX adds another macro called <code>\@sanitize</code> representing the same character set, but without the curly braces. The macros <code>\bbl@add@special<char></code> and <code>\bbl@remove@special<char></code> add and remove the character <code><char></code> to these two sets.</p>

3.5 Support for saving macro definitions

Language definition files may want to *redefine* macros that already exist. Therefore a mechanism for saving (and restoring) the original definition of those macros is provided.

We provide two macros for this²⁷.

`\babel@save` To save the current meaning of any control sequence, the macro `\babel@save` is provided. It takes one argument, `\csname`, the control sequence for which the meaning has to be saved.

`\babel@savevariable` A second macro is provided to save the current value of a variable. In this context, anything that is allowed after the `\the` primitive is considered to be a variable. The macro takes one argument, the `\variable`.
The effect of the preceding macros is to append a piece of code to the current definition of `\originalTeX`. When `\originalTeX` is expanded, this code restores the previous definition of the control sequence or the previous value of the variable.

3.6 Support for extending macros

`\addto` The macro `\addto{<control sequence>}{<TeX code>}` can be used to extend the definition of a macro. The macro need not be defined (ie, it can be undefined or `\relax`). This macro can, for instance, be used in adding instructions to a macro like `\extrasenglish`. Be careful when using this macro, because depending on the case the assignment could be either global (usually) or local (sometimes). That does not seem very consistent, but this behavior is preserved for backward compatibility. If you are using `etoolbox`, by Philipp Lehman, consider using the tools provided by this package instead of `\addto`.

3.7 Macros common to a number of languages

`\bbl@allowhyphens` In several languages compound words are used. This means that when `TeX` has to hyphenate such a compound word, it only does so at the ‘-’ that is used in such words. To allow hyphenation in the rest of such a compound word, the macro `\bbl@allowhyphens` can be used.

`\allowhyphens` Same as `\bbl@allowhyphens`, but does nothing if the encoding is `T1`. It is intended mainly for characters provided as real glyphs by this encoding but constructed with `\accent` in `OT1`.

Note the previous command (`\bbl@allowhyphens`) has different applications (hyphens and discretionaries) than this one (composite chars). Note also prior to version 3.7, `\allowhyphens` had the behavior of `\bbl@allowhyphens`.

`\set@low@box` For some languages, quotes need to be lowered to the baseline. For this purpose the macro `\set@low@box` is available. It takes one argument and puts that argument in an `\hbox`, at the baseline. The result is available in `\box0` for further processing.

`\save@sf@q` Sometimes it is necessary to preserve the `\spacefactor`. For this purpose the macro `\save@sf@q` is available. It takes one argument, saves the current `spacefactor`, executes the argument, and restores the `spacefactor`.

`\bbl@frenchspacing`
`\bbl@nonfrenchspacing` The commands `\bbl@frenchspacing` and `\bbl@nonfrenchspacing` can be used to properly switch French spacing on and off.

3.8 Encoding-dependent strings

New 3.9a Babel 3.9 provides a way of defining strings in several encodings, intended mainly for `luatex` and `xetex`. This is the only new feature requiring changes in language files if you want to make use of it.

Furthermore, it must be activated explicitly, with the package option `strings`. If there is no `strings`, these blocks are ignored, except `\SetCases` (and except if forced as described below). In other words, the old way of defining/switching strings still works and it’s used by default.

²⁷This mechanism was introduced by Bernd Raichle.

It consist is a series of blocks started with `\StartBabelCommands`. The last block is closed with `\EndBabelCommands`. Each block is a single group (ie, local declarations apply until the next `\StartBabelCommands` or `\EndBabelCommands`). An ldf may contain several series of this kind.

Thanks to this new feature, string values and string language switching are not mixed any more. No need of `\addto`. If the language is french, just redefine `\frenchchaptername`.

`\StartBabelCommands` $\langle\text{language-list}\rangle\{\langle\text{category}\rangle\}[\langle\text{selector}\rangle]$

The $\langle\text{language-list}\rangle$ specifies which languages the block is intended for. A block is taken into account only if the `\CurrentOption` is listed here. Alternatively, you can define `\BabelLanguages` to a comma-separated list of languages to be defined (if undefined, `\StartBabelCommands` sets it to `\CurrentOption`). You may write `\CurrentOption` as the language, but this is discouraged – a explicit name (or names) is much better and clearer. A “selector” is a name to be used as value in package option strings, optionally followed by extra info about the encodings to be used. The name unicode must be used for xetex and luatex (the key strings has also other two special values: generic and encoded). If a string is set several times (because several blocks are read), the first one takes precedence (ie, it works much like `\providecommand`).

Encoding info is `charset=` followed by a charset, which if given sets how the strings should be translated to the internal representation used by the engine, typically utf8, which is the only value supported currently (default is no translations). Note `charset` is applied by luatex and xetex when reading the file, not when the macro or string is used in the document.

A list of font encodings which the strings are expected to work with can be given after `fontenc=` (separated with spaces, if two or more) – recommended, but not mandatory, although blocks without this key are not taken into account if you have requested `strings=encoded`.

Blocks without a selector are read always if the key strings has been used. They provide fallback values, and therefore must be the last blocks; they should be provided always if possible and all strings should be defined somehow inside it; they can be the only blocks (mainly LGC scripts using the LICR). Blocks without a selector can be activated explicitly with `strings=generic` (no block is taken into account except those). With `strings=encoded`, strings in those blocks are set as default (internally, ?). With `strings=encoded` strings are protected, but they are correctly expanded in `\MakeUppercase` and the like. If there is no key strings, string definitions are ignored, but `\SetCases` are still honored (in a encoded way).

The $\langle\text{category}\rangle$ is either captions, date or extras. You must stick to these three categories, even if no error is raised when using other name.²⁸ It may be empty, too, but in such a case using `\SetString` is an error (but not `\SetCase`).

```
\StartBabelCommands{language}{captions}
  [unicode, fontenc=TU EU1 EU2, charset=utf8]
\SetString{\chaptername}{utf8-string}

\StartBabelCommands{language}{captions}
\SetString{\chaptername}{ascii-maybe-LICR-string}

\EndBabelCommands
```

A real example is:

²⁸In future releases further categories may be added.

```

\StartBabelCommands{austrian}{date}
[unicode, fontenc=TU EU1 EU2, charset=utf8]
\SetString\monthiname{Jänner}

\StartBabelCommands{german,austrian}{date}
[unicode, fontenc=TU EU1 EU2, charset=utf8]
\SetString\monthiiiname{März}

\StartBabelCommands{austrian}{date}
\SetString\monthiname{J\"{a}nner}

\StartBabelCommands{german}{date}
\SetString\monthiname{Januar}

\StartBabelCommands{german,austrian}{date}
\SetString\monthiiname{Februar}
\SetString\monthiiiname{M\"{a}rz}
\SetString\monthivname{April}
\SetString\monthvname{Mai}
\SetString\monthviname{Juni}
\SetString\monthviiname{Juli}
\SetString\monthviiiname{August}
\SetString\monthixname{September}
\SetString\monthxname{Oktober}
\SetString\monthxiname{November}
\SetString\monthxiiname{Dezenber}
\SetString\today{\number\day.~%
\csname month\romannumeral\month name\endcsname\space
\number\year}

\StartBabelCommands{german,austrian}{captions}
\SetString\prefacename{Vorwort}
[etc.]

\EndBabelCommands

```

When used in ldf files, previous values of $\langle category \rangle \langle language \rangle$ are overridden, which means the old way to define strings still works and used by default (to be precise, is first set to undefined and then strings are added). However, when used in the preamble or in a package, new settings are added to the previous ones, if the language exists (in the babel sense, ie, if $\backslash date \langle language \rangle$ exists).

$\backslash StartBabelCommands$  $\{ \langle language-list \rangle \} \{ \langle category \rangle \} [\langle selector \rangle]$

The starred version just forces strings to take a value – if not set as package option, then the default for the engine is used. This is not done by default to prevent backward incompatibilities, but if you are creating a new language this version is better. It's up to the maintainers of the current languages to decide if using it is appropriate.²⁹

$\backslash EndBabelCommands$ Marks the end of the series of blocks.

$\backslash AfterBabelCommands$ $\{ \langle code \rangle \}$

The code is delayed and executed at the global scope just after $\backslash EndBabelCommands$.

²⁹This replaces in 3.9g a short-lived $\backslash UseStrings$ which has been removed because it did not work.

\SetString {*<macro-name>*}{*<string>*}

Adds *<macro-name>* to the current category, and defines globally *<lang-macro-name>* to *<code>* (after applying the transformation corresponding to the current charset or defined with the hook `stringprocess`).

Use this command to define strings, without including any “logic” if possible, which should be a separated macro. See the example above for the date.

\SetStringLoop {*<macro-name>*}{*<string-list>*}

A convenient way to define several ordered names at once. For example, to define `\abmoniname`, `\abmoniiname`, etc. (and similarly with `abday`):

```
\SetStringLoop{abmon#1name}{en,fb,mr,ab,my,jn,jl,ag,sp,oc,nv,dc}
\SetStringLoop{abday#1name}{lu,ma,mi,ju,vi,sa,do}
```

#1 is replaced by the roman numeral.

\SetCase [*<map-list>*]{*<toupper-code>*}{*<tolower-code>*}

Sets globally code to be executed at `\MakeUppercase` and `\MakeLowercase`. The code would typically be things like `\let\BB\bb` and `\uccode` or `\lccode` (although for the reasons explained above, changes in lc/uc codes may not work). A *<map-list>* is a series of macros using the internal format of `\@uclclist` (eg, `\bb\BB\cc\CC`). The mandatory arguments take precedence over the optional one. This command, unlike `\SetString`, is executed always (even without strings), and it is intended for minor readjustments only. For example, as T1 is the default case mapping in \TeX , we could set for Turkish:

```
\StartBabelCommands{turkish}{}[ot1enc, fontenc=OT1]
\SetCase
{\uccode"10=`I\relax}
{\lccode`I="10\relax}

\StartBabelCommands{turkish}{}[unicode, fontenc=TU EU1 EU2, charset=utf8]
\SetCase
{\uccode`i=`I\relax
 \uccode`I=`i\relax}
{\lccode`i=`i\relax
 \lccode`I=`I\relax}

\StartBabelCommands{turkish}{}
\SetCase
{\uccode`i="9D\relax
 \uccode"19=`I\relax}
{\lccode"9D=`i\relax
 \lccode`I="19\relax}

\EndBabelCommands
```

(Note the mapping for OT1 is not complete.)

\SetHyphenMap {*<to-lower-macros>*}

New 3.9g Case mapping serves in \TeX for two unrelated purposes: case transforms (upper/lower) and hyphenation. `\SetCase` handles the former, while hyphenation is handled by `\SetHyphenMap` and controlled with the package option `hyphenmap`. So, even if internally they are based on the same \TeX primitive (`\lccode`), babel sets them separately.

There are three helper macros to be used inside `\SetHyphenMap`:

- `\BabelLower{⟨uccode⟩}{⟨lccode⟩}` is similar to `\lccode` but it's ignored if the char has been set and saves the original `lccode` to restore it when switching the language (except with `hyphenmap=first`).
- `\BabelLowerMM{⟨uccode-from⟩}{⟨uccode-to⟩}{⟨step⟩}{⟨lccode-from⟩}` loops through the given uppercase codes, using the step, and assigns them the `lccode`, which is also increased (MM stands for *many-to-many*).
- `\BabelLowerMO{⟨uccode-from⟩}{⟨uccode-to⟩}{⟨step⟩}{⟨lccode⟩}` loops through the given uppercase codes, using the step, and assigns them the `lccode`, which is fixed (MO stands for *many-to-one*).

An example is (which is redundant, because these assignments are done by both `luatex` and `xetex`):

```
\SetHyphenMap{\BabelLowerMM{"100"}{"11F"}{2}{"101"}}
```

This macro is not intended to fix wrong mappings done by Unicode (which are the default in both `xetex` and `luatex`) – if an assignment is wrong, fix it directly.

4 Changes

4.1 Changes in babel version 3.9

Most of the changes in version 3.9 were related to bugs, either to fix them (there were lots), or to provide some alternatives. Even new features like `\babelhyphen` are intended to solve a certain problem (in this case, the lacking of a uniform syntax and behavior for shorthands across languages). These changes are described in this manual in the corresponding place. A selective list follows:

- `\select@language` did not set `\language`. This meant the language in force when auxiliary files were loaded was the one used in, for example, shorthands – if the language was `german`, a `\select@language{spanish}` had no effect.
- `\foreignlanguage` and `otherlanguage*` messed up `\extras<language>`. Scripts, encodings and many other things were not switched correctly.
- The `:ENC` mechanism for hyphenation patterns used the encoding of the *previous* language, not that of the language being selected.
- `'` (with `activeacute`) had the original value when writing to an auxiliary file, and things like an infinite loop could happen. It worked incorrectly with `^` (if activated) and also if deactivated.
- Active chars were not reset at the end of language options, and that led to incompatibilities between languages.
- `\textormath` raised an error with a conditional.
- `\aliasshorthand` didn't work (or only in a few and very specific cases).
- `\l@english` was defined incorrectly (using `\let` instead of `\chardef`).
- `ldf` files not bundled with `babel` were not recognized when called as global options.

Part II

Source code

babel is being developed incrementally, which means parts of the code are under development and therefore incomplete. Only documented features are considered complete. In other words, use babel only as documented (except, of course, if you want to explore and test them – you can post suggestions about multilingual issues to kadingira@tug.org on <http://tug.org/mailman/listinfo/kadingira>).

5 Identification and loading of required files

Code documentation is still under revision.

The following description is no longer valid, because switch and plain have been merged into babel.def.

The babel package after unpacking consists of the following files:

switch.def defines macros to set and switch languages.

babel.def defines the rest of macros. It has two parts: a generic one and a second one only for LaTeX.

babel.sty is the \LaTeX package, which sets options and loads language styles.

plain.def defines some \LaTeX macros required by babel.def and provides a few tools for Plain.

hyphen.cfg is the file to be used when generating the formats to load hyphenation patterns.

The babel installer extends docstrip with a few “pseudo-guards” to set “variables” used at installation time. They are used with `<@name@>` at the appropriated places in the source code and shown below with `<<name>>`. That brings a little bit of literate programming.

6 locale directory

A required component of babel is a set of ini files with basic definitions for about 200 languages. They are distributed as a separate zip file, not packed as dtx. With them, babel will fully support Unicode engines.

Most of them are essentially finished (except bugs and mistakes, of course). Some of them are still incomplete (but they will be usable), and there are some omissions (eg, Latin and polytonic Greek, and there are no geographic areas in Spanish). Hindi, French, Occitan and Breton will show a warning related to dates. Not all include LICR variants.

This is a preliminary documentation.

ini files contain the actual data; tex files are currently just proxies to the corresponding ini files.

Most keys are self-explanatory.

charset the encoding used in the ini file.

version of the ini file

level “version” of the ini specification . which keys are available (they may grow in a compatible way) and how they should be read.

encodings a descriptive list of font encodings.

[captions] section of captions in the file charset

[captions.licr] same, but in pure ASCII using the LICR

date.long fields are as in the CLDR, but the syntax is different. Anything inside brackets is a date field (eg, MMMM for the month name) and anything outside is text. In addition, [] is a non breakable space and [.] is an abbreviation dot.

Keys may be further qualified in a particular language with a suffix starting with a uppercase letter. It can be just a letter (eg, babel.name.A, babel.name.B) or a name (eg, date.long.Nominative, date.long.Formal, but no language is currently using the latter). Multi-letter qualifiers are forward compatible in the sense they won't conflict with new "global" keys (all lowercase).

7 Tools

```
1 <<version=3.42.1977>>
2 <<date=2020/04/14>>
```

Do not use the following macros in ldf files. They may change in the future. This applies mainly to those recently added for replacing, trimming and looping. The older ones, like `\bbl@afterfi`, will not change.

We define some basic macros which just make the code cleaner. `\bbl@add` is now used internally instead of `\addto` because of the unpredictable behavior of the latter. Used in `babel.def` and in `babel.sty`, which means in \LaTeX is executed twice, but we need them when defining options and `babel.def` cannot be load until options have been defined. This does not hurt, but should be fixed somehow.

```
3 <<*Basic macros>> ≡
4 \bbl@trace{Basic macros}
5 \def\bbl@stripslash{\expandafter\@gobble\string}
6 \def\bbl@add#1#2{%
7   \bbl@ifunset{\bbl@stripslash#1}%
8     {\def#1{#2}}%
9     {\expandafter\def\expandafter#1\expandafter{#1#2}}

```

`\bbl@add@list` This internal macro adds its second argument to a comma separated list in its first argument. When the list is not defined yet (or empty), it will be initiated. It presumes expandable character strings.

```
21 \def\bbl@add@list#1#2{%
22   \edef#1{%
23     \bbl@ifunset{\bbl@stripslash#1}%
24     {}%
25     {\ifx#1\empty\else#1,\fi}%
26     #2}}
```

`\bbl@afterelse` `\bbl@afterfi` Because the code that is used in the handling of active characters may need to look ahead, we take extra care to 'throw' it over the `\else` and `\fi` parts of an `\if`-statement³⁰. These macros will break if another `\if... \fi` statement appears in one of the arguments and it is not enclosed in braces.

```
27 \long\def\bbl@afterelse#1\else#2\fi{\fi#1}
28 \long\def\bbl@afterfi#1\fi{\fi#1}
```

³⁰This code is based on code presented in TUGboat vol. 12, no2, June 1991 in "An expansion Power Lemma" by Sonja Maus.

`\bbl@exp` Now, just syntactical sugar, but it makes partial expansion of some code a lot more simple and readable. Here `\` stands for `\noexpand` and `\<. .>` for `\noexpand` applied to a built macro name (the latter does not define the macro if undefined to `\relax`, because it is created locally). The result may be followed by extra arguments, if necessary.

```
29 \def\bbl@exp#1{%
30   \begingroup
31   \let\ \noexpand
32   \def\<##1>{\expandafter\noexpand\csname##1\endcsname}%
33   \edef\bbl@exp@aux{\endgroup#1}%
34   \bbl@exp@aux}
```

`\bbl@trim` The following piece of code is stolen (with some changes) from `keyval`, by David Carlisle. It defines two macros: `\bbl@trim` and `\bbl@trim@def`. The first one strips the leading and trailing spaces from the second argument and then applies the first argument (a macro, `\toks@` and the like). The second one, as its name suggests, defines the first argument as the stripped second argument.

```
35 \def\bbl@tempa#1{%
36   \long\def\bbl@trim##1##2{%
37     \futurelet\bbl@trim@a\bbl@trim@c##2\@nil\@nil#1\@nil\relax{##1}}%
38   \def\bbl@trim@c{%

```

An extension to the previous macro. It takes into account the parameters, and it is string based (ie, if you replace elax by ho, then \relax becomes \rho). No checking is done at all, because it is not a general purpose macro, and it is used by babel only when it works (an example where it does *not* work is in \bbl@TG@@date, and also fails if there are macros with spaces, because they are retokenized). It may change! (or even merged with \bbl@replace; I'm not sure ckecking the replacement is really necessary or just paranoia).

```

Some files identify themselves with a \LaTeX macro. The following code is placed before them to define (and then undefine) if not in \LaTeX .

```

153 << *Make sure ProvidesFile is defined >> ≡
154 \ifx\ProvidesFile\@undefined
155 \def\ProvidesFile#1[#2 #3 #4]{%
156 \wlog{File: #1 #4 #3 <#2>}%
157 \let\ProvidesFile\@undefined}
158 \fi
159 <</Make sure ProvidesFile is defined>>

```

7.1 Multiple languages

- `\language` Plain \TeX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter. The following block is used in `switch.def` and `hyphen.cfg`; the latter may seem redundant, but remember `babel` doesn't require loading `switch.def` in the format.
- ```

160 <<*Define core switching macros>> ≡
161 \ifx\language\@undefined
162 \csname newcount\endcsname\language
163 \fi
164 <</Define core switching macros>>

```
- `\last@language` Another counter is used to store the last language defined. For pre-3.0 formats an extra counter has to be allocated.
- `\addlanguage` To add languages to  $\TeX$ 's memory plain  $\TeX$  version 3.0 supplies `\newlanguage`, in a pre-3.0 environment a similar macro has to be provided. For both cases a new macro is defined here, because the original `\newlanguage` was defined to be `\outer`. For a format based on plain version 2.x, the definition of `\newlanguage` can not be copied because `\count 19` is used for other purposes in these formats. Therefore `\addlanguage` is defined using a definition based on the macros used to define `\newlanguage` in plain  $\TeX$  version 3.0. For formats based on plain version 3.0 the definition of `\newlanguage` can be simply copied, removing `\outer`. Plain  $\TeX$  version 3.0 uses `\count 19` for this purpose.
- ```

165 <<*Define core switching macros>> ≡
166 \ifx\newlanguage\@undefined
167   \csname newcount\endcsname\last@language
168   \def\addlanguage#1{%
169     \global\advance\last@language\@ne
170     \ifnum\last@language<\@ccclvi
171       \else
172         \errmessage{No room for a new \string\language!}%
173       \fi
174     \global\chardef#1\last@language
175     \wlog{\string#1 = \string\language\the\last@language}}
176 \else
177   \countdef\last@language=19
178   \def\addlanguage{\alloc@9\language\chardef\@ccclvi}
179 \fi
180 <</Define core switching macros>>

```

Now we make sure all required files are loaded. When the command `\AtBeginDocument` doesn't exist we assume that we are dealing with a plain-based format or \LaTeX 2.09. In that case the file `plain.def` is needed (which also defines `\AtBeginDocument`, and therefore it is not loaded twice). We need the first part when the format is created, and `\orig@dump` is used as a flag. Otherwise, we need to use the second part, so `\orig@dump` is not defined (`plain.def` undefines it).

Check if the current version of `switch.def` has been previously loaded (mainly, `hyphen.cfg`). If not, load it now. We cannot load `babel.def` here because we first need to declare and process the package options.

7.2 The Package File (\LaTeX , `babel.sty`)

In order to make use of the features of \LaTeX 2 ϵ , the `babel` system contains a package file, `babel.sty`. This file is loaded by the `\usepackage` command and defines all the language

options whose name is different from that of the .ldf file (like variant spellings). It also takes care of a number of compatibility issues with other packages and defines a few additional package options.

Apart from all the language options below we also have a few options that influence the behavior of language definition files.

Many of the following options don't do anything themselves, they are just defined in order to make it possible for babel and language definition files to check if one of them was specified by the user.

7.3 base

The first option to be processed is base, which sets the hyphenation patterns then resets `ver@babel.sty` so that \TeX forgets about the first loading. After `switch.def` has been loaded (above) and `\AfterBabelLanguage` defined, exits.

```

7.4 key=value options and other general option

The following macros extract language modifiers, and only real package options are kept in the option list. Modifiers are saved and assigned to `\BabelModifiers` at `\bbl@load@language`; when no modifiers have been given, the former is `\relax`. How modifiers are handled are left to language styles; they can use `\in@`, loop them with `\@for` or `load keyval`, for example.

```

285 \bbl@trace{key=value and another general options}
286 \bbl@csarg\let\tempa\expandafter\csname opt@babel.sty\endcsname
287 \def\bbl@tempb#1.#2{%
288   #1\ifx\@empty#2\else,\bbl@afterfi\bbl@tempb#2\fi}%
289 \def\bbl@tempd#1.#2@nnil{%

299 \fi}
300 \let\bbl@tempc\@empty
301 \bbl@foreach\bbl@tempa{\bbl@tempd#1.\@empty\@nnil}
302 \expandafter\let\csname opt@babel.sty\endcsname\bbl@tempc

```

The next option tells babel to leave shorthand characters active at the end of processing the package. This is *not* the default as it can cause problems with other packages, but for those who want to use the shorthand characters in the preamble of their documents this can help.

```

303 \DeclareOption{KeepShorthandsActive}{}
304 \DeclareOption{activeacute}{}
305 \DeclareOption{activegrave}{}
306 \DeclareOption{debug}{}
307 \DeclareOption{noconfigs}{}
308 \DeclareOption{showlanguages}{}
309 \DeclareOption{silent}{}
310 \DeclareOption{mono}{}
311 \DeclareOption{shorthands=off}{\bbl@tempa shorthands=\bbl@tempa}
312 % Don't use. Experimental:
313 \newif\ifbbl@single
314 \DeclareOption{selectors=off}{\bbl@singletrue}
315 <<More package options>>

```

Handling of package options is done in three passes. (I [JBL] am not very happy with the idea, anyway.) The first one processes options which has been declared above or follow the syntax `<key>=<value>`, the second one loads the requested languages, except the main one if set with the key `main`, and the third one loads the latter. First, we “flag” valid keys with a `nil` value.

```

316 \let\bbl@opt@shorthands\@nnil
317 \let\bbl@opt@config\@nnil
318 \let\bbl@opt@main\@nnil
319 \let\bbl@opt@headfoot\@nnil
320 \let\bbl@opt@layout\@nnil

```

The following tool is defined temporarily to store the values of options.

```

321 \def\bbl@tempa#1=#2\bbl@tempa{%
322   \bbl@csarg\ifx{opt@#1}\@nnil
323     \bbl@csarg\edef{opt@#1}{#2}%
324   \else
325     \bbl@error{%
326       Bad option `#1=#2'. Either you have misspelled the\\%
327       key or there is a previous setting of `#1'}{%
328       Valid keys are `shorthands', `config', `strings', `main',\\%
329       `headfoot', `safe', `math', among others.}
330   \fi}

```

Now the option list is processed, taking into account only currently declared options (including those declared with a =), and <key>=<value> options (the former take precedence). Unrecognized options are saved in \bbl@language@opts, because they are language options.

```

331 \let\bbl@language@opts\@empty
332 \DeclareOption*{%
333   \bbl@xin@{\string=}{\CurrentOption}%
334   \ifin@
335     \expandafter\bbl@tempa\CurrentOption\bbl@tempa
336   \else
337     \bbl@add@list\bbl@language@opts{\CurrentOption}%
338   \fi}

```

Now we finish the first pass (and start over).

```

339 \ProcessOptions*

```

7.5 Conditional loading of shorthands

If there is no shorthands=<chars>, the original babel macros are left untouched, but if there is, these macros are wrapped (in babel.def) to define only those given. A bit of optimization: if there is no shorthands=, then \bbl@ifshorthand is always true, and it is always false if shorthands is empty. Also, some code makes sense only with shorthands=...

```

340 \bbl@trace{Conditional loading of shorthands}
341 \def\bbl@sh@string#1{%
342   \ifx#1\@empty\else
343     \ifx#1t\string~%
344     \else\ifx#1c\string,%
345     \else\string#1%
346   \fi\fi
347   \expandafter\bbl@sh@string
348 \fi}
349 \ifx\bbl@opt@shorthands\@nnil
350   \def\bbl@ifshorthand#1#2#3{#2}%
351 \else\ifx\bbl@opt@shorthands\@empty
352   \def\bbl@ifshorthand#1#2#3{#3}%
353 \else

```

The following macro tests if a shorthand is one of the allowed ones.

```

354 \def\bbl@ifshorthand#1{%
355   \bbl@xin@{\string#1}{\bbl@opt@shorthands}%
356   \ifin@
357     \expandafter\@firstoftwo
358   \else
359     \expandafter\@secondoftwo
360   \fi}

```

We make sure all chars in the string are ‘other’, with the help of an auxiliary macro defined above (which also zaps spaces).

```

361 \edef\bbl@opt@shorthands{%
362   \expandafter\bbl@sh@string\bbl@opt@shorthands\@empty}%

```

The following is ignored with shorthands=off, since it is intended to take some additional actions for certain chars.

```

363 \bbl@ifshorthand{'}%
364   {\PassOptionsToPackage{activeacute}{babel}}{}
365 \bbl@ifshorthand{`}%
366   {\PassOptionsToPackage{activegrave}{babel}}{}
367 \fi\fi

```

With headfoot=lang we can set the language used in heads/foots. For example, in babel/3796 just adds headfoot=english. It misuses \@resetactivechars but seems to work.

```

368 \ifx\bbl@opt@headfoot\@nnil\else
369   \g@addto@macro\@resetactivechars{%
370     \set@typeset@protect
371     \expandafter\select@language@x\expandafter{\bbl@opt@headfoot}%
372     \let\protect\noexpand}
373 \fi

```

For the option safe we use a different approach – \bbl@opt@safe says which macros are redefined (B for bibs and R for refs). By default, both are set.

```

374 \ifx\bbl@opt@safe\@undefined
375   \def\bbl@opt@safe{BR}
376 \fi
377 \ifx\bbl@opt@main\@nnil\else
378   \edef\bbl@language@opts{%
379     \ifx\bbl@language@opts\@empty\else\bbl@language@opts,\fi
380     \bbl@opt@main}
381 \fi

```

For layout an auxiliary macro is provided, available for packages and language styles.

```

382 \bbl@trace{Defining IfBabelLayout}
383 \ifx\bbl@opt@layout\@nnil
384   \newcommand\IfBabelLayout[3]{#3}%
385 \else
386   \newcommand\IfBabelLayout[1]{%
387     \@expandtwoargs\in@{.#1.}{.\bbl@opt@layout.}%
388     \ifin@
389       \expandafter\@firstoftwo
390     \else
391       \expandafter\@secondoftwo
392     \fi}
393 \fi

```

Common definitions. *In progress.* Still based on babel.def.

```

394 \input babel.def

```

7.6 Cross referencing macros

The \LaTeX book states:

The *key* argument is any sequence of letters, digits, and punctuation symbols; upper- and lowercase letters are regarded as different.

When the above quote should still be true when a document is typeset in a language that has active characters, special care has to be taken of the category codes of these characters when they appear in an argument of the cross referencing macros.

When a cross referencing command processes its argument, all tokens in this argument should be character tokens with category ‘letter’ or ‘other’.

The only way to accomplish this in most cases is to use the trick described in the \TeX book [4] (Appendix D, page 382). The primitive \meaning applied to a token expands to the current meaning of this token. For example, ‘ $\text{\meaning}\text{\A}$ ’ with \A defined as ‘ $\text{\def}\text{\A}\text{\#1}\text{\B}$ ’ expands to the characters ‘ $\text{\macro}:\text{\#1}->\text{\B}$ ’ with all category codes set to ‘other’ or ‘space’.

\newlabel The macro \label writes a line with a \newlabel command into the .aux file to define labels.

```
395 %\bbl@redefine\newlabel#1#2{%
396 % \@safe@activetrue\org@newlabel{#1}{#2}\@safe@activesfalse}
```

\@newl@bel We need to change the definition of the \LaTeX -internal macro \@newl@bel . This is needed because we need to make sure that shorthand characters expand to their non-active version.

The following package options control which macros are to be redefined.

```
397 <<{*More package options}>> \equiv
398 \DeclareOption{safe=none}{\let\bbl@opt@safe\empty}
399 \DeclareOption{safe=bib}{\def\bbl@opt@safe{B}}
400 \DeclareOption{safe=ref}{\def\bbl@opt@safe{R}}
401 <</More package options>>
```

First we open a new group to keep the changed setting of \protect local and then we set the \@safe@actives switch to true to make sure that any shorthand that appears in any of the arguments immediately expands to its non-active self.

```
402 \bbl@trace{Cross referencing macros}
403 \ifx\bbl@opt@safe\empty\else
404   \def\@newl@bel#1#2#3{%
405     {\@safe@activetrue
406       \bbl@ifunset{#1@#2}%
407         \relax
408         {\gdef\@multiplelabels{%
409           \@latex@warning@no@line{There were multiply-defined labels}}%
410           \@latex@warning@no@line{Label `#2' multiply defined}}%
411       \global\@namedef{#1@#2}{#3}}}
```

\@testdef An internal \LaTeX macro used to test if the labels that have been written on the .aux file have changed. It is called by the \enddocument macro. This macro needs to be completely rewritten, using \meaning . The reason for this is that in some cases the expansion of \#1@#2 contains the same characters as the \#3 ; but the character codes differ. Therefore \LaTeX keeps reporting that the labels may have changed.

```
412 \CheckCommand*\@testdef[3]{%
413   \def\reserved@a{#3}%
414   \expandafter\ifx\csname#1@#2\endcsname\reserved@a
415   \else
416     \@tempwattrue
417   \fi}
```

Now that we made sure that `\@testdef` still has the same definition we can rewrite it. First we make the shorthands ‘safe’.

```
418 \def\@testdef#1#2#3{%
419   \@safe@activestru
```

Then we use `\bbl@tempa` as an ‘alias’ for the macro that contains the label which is being checked.

```
420   \expandafter\let\expandafter\bbl@tempa\csname #1@#2\endcsname
```

Then we define `\bbl@tempb` just as `\@newl@bel` does it.

```
421   \def\bbl@tempb{#3}%
422   \@safe@activesfalse
```

When the label is defined we replace the definition of `\bbl@tempa` by its meaning.

```
423   \ifx\bbl@tempa\relax
424   \else
425     \edef\bbl@tempa{\expandafter\strip@prefix\meaning\bbl@tempa}%
426   \fi
```

We do the same for `\bbl@tempb`.

```
427   \edef\bbl@tempb{\expandafter\strip@prefix\meaning\bbl@tempb}%
```

If the label didn’t change, `\bbl@tempa` and `\bbl@tempb` should be identical macros.

```
428   \ifx\bbl@tempa\bbl@tempb
429   \else
430     \@tempswatrue
431   \fi}
432 \fi
```

`\ref` The same holds for the macro `\ref` that references a label and `\pageref` to reference a page. So we redefine `\ref` and `\pageref`. While we change these macros, we make them robust as well (if they weren’t already) to prevent problems if they should become expanded at the wrong moment.

```
433 \bbl@xin@{R}\bbl@opt@safe
434 \ifin@
435   \bbl@redefineroobust\ref#1{%
436     \@safe@activestru\org@ref{#1}\@safe@activesfalse}
437   \bbl@redefineroobust\pageref#1{%
438     \@safe@activestru\org@pageref{#1}\@safe@activesfalse}
439 \else
440   \let\org@ref\ref
441   \let\org@pageref\pageref
442 \fi
```

`\@citex` The macro used to cite from a bibliography, `\cite`, uses an internal macro, `\@citex`. It is this internal macro that picks up the argument(s), so we redefine this internal macro and leave `\cite` alone. The first argument is used for typesetting, so the shorthands need only be deactivated in the second argument.

```
443 \bbl@xin@{B}\bbl@opt@safe
444 \ifin@
445   \bbl@redefine\@citex[#1]#2{%
446     \@safe@activestru\edef\@tempa{#2}\@safe@activesfalse
447     \org@@citex[#1]{\@tempa}}
```

Unfortunately, the packages `natbib` and `cite` need a different definition of `\@citex`... To begin with, `natbib` has a definition for `\@citex` with *three* arguments... We only know that a package is loaded when `\begin{document}` is executed, so we need to postpone the different redefinition.

```

448 \AtBeginDocument{%
449   \ifpackageloaded{natbib}{%

```

Notice that we use `\def` here instead of `\bbl@redefine` because `\org@citex` is already defined and we don't want to overwrite that definition (it would result in parameter stack overflow because of a circular definition).

(Recent versions of `natbib` change dynamically `\@citex`, so PR4087 doesn't seem fixable in a simple way. Just load `natbib` before.)

```

450   \def\@citex[#1][#2]#3{%
451     \@safe@activestrue\edef\@tempa{#3}\@safe@activesfalse
452     \org@citex[#1][#2]{\@tempa}}%
453   }{}

```

The package `cite` has a definition of `\@citex` where the shorthands need to be turned off in both arguments.

```

454 \AtBeginDocument{%
455   \@ifpackageloaded{cite}{%
456     \def\@citex[#1]#2{%
457       \@safe@activestrue\org@citex[#1][#2]\@safe@activesfalse}%
458     }{}

```

`\nocite` The macro `\nocite` which is used to instruct BiB_T_EX to extract uncited references from the database.

```

459   \bbl@redefine\nocite#1{%
460     \@safe@activestrue\org@nocite{#1}\@safe@activesfalse}

```

`\bibcite` The macro that is used in the `.aux` file to define citation labels. When packages such as `natbib` or `cite` are not loaded its second argument is used to typeset the citation label. In that case, this second argument can contain active characters but is used in an environment where `\@safe@activestrue` is in effect. This switch needs to be reset inside the `\hbox` which contains the citation label. In order to determine during `.aux` file processing which definition of `\bibcite` is needed we define `\bibcite` in such a way that it redefines itself with the proper definition. We call `\bbl@cite@choice` to select the proper definition for `\bibcite`. This new definition is then activated.

```

461   \bbl@redefine\bibcite{%
462     \bbl@cite@choice
463     \bibcite}

```

`\bbl@bibcite` The macro `\bbl@bibcite` holds the definition of `\bibcite` needed when neither `natbib` nor `cite` is loaded.

```

464   \def\bbl@bibcite#1#2{%
465     \org@bibcite{#1}{\@safe@activesfalse#2}}

```

`\bbl@cite@choice` The macro `\bbl@cite@choice` determines which definition of `\bibcite` is needed. First we give `\bibcite` its default definition.

```

466   \def\bbl@cite@choice{%
467     \global\let\bibcite\bbl@bibcite

```

Then, when `natbib` is loaded we restore the original definition of `\bibcite`. For `cite` we do the same.

```

468   \@ifpackageloaded{natbib}{\global\let\bibcite\org@bibcite}{}%
469   \@ifpackageloaded{cite}{\global\let\bibcite\org@bibcite}{}%

```

Make sure this only happens once.

```

470   \global\let\bbl@cite@choice\relax}

```

When a document is run for the first time, no .aux file is available, and \babcite will not yet be properly defined. In this case, this has to happen before the document starts.

```
471 \AtBeginDocument{\bbl@cite@choice}
```

\bibitem One of the two internal L^AT_EX macros called by \bibitem that write the citation label on the .aux file.

```
472 \bbl@redefine\bibitem#1{%
473   \@safe@activetrue\org@bibitem{#1}\@safe@activesfalse}
474 \else
475   \let\org@nocite\nocite
476   \let\org@@citex\citex
477   \let\org@babcite\babcite
478   \let\org@bibitem\bibitem
479 \fi
```

7.7 Marks

\markright Because the output routine is asynchronous, we must pass the current language attribute to the head lines, together with the text that is put into them. To achieve this we need to adapt the definition of \markright and \markboth somewhat. We check whether the argument is empty; if it is, we just make sure the scratch token register is empty. Next, we store the argument to \markright in the scratch token register. This way these commands will not be expanded later, and we make sure that the text is typeset using the correct language settings. While doing so, we make sure that active characters that may end up in the mark are not disabled by the output routine kicking in while \@safe@activetrue is in effect.

```
480 \bbl@trace{Marks}
481 \IfBabelLayout{sectioning}
482   {\ifx\bbl@opt@headfoot\@nnil
483     \g@addto@macro\@resetactivechars{%
484       \set@typeset@protect
485       \expandafter\select@language@x\expandafter{\bbl@main@language}%
486       \let\protect\noexpand
487       \edef\thepage{%
488         \noexpand\babelsublr{\unexpanded\expandafter{\thepage}}}%
489     \fi}
490   {\ifbbl@single\else
491     \bbl@ifunset{markright } \bbl@redefine\bbl@redefineroobust
492     \markright#1{%
493       \bbl@ifblank{#1}%
494       {\org@markright{}}}%
495     {\toks@{#1}%
496       \bbl@exp{%
497         \org@markright{\protect\foreignlanguage{\languagename}%
498           {\protect\bbl@restore@actives\the\toks@}}}%
499     }
```

\markboth The definition of \markboth is equivalent to that of \markright, except that we need two token registers. The documentclasses report and book define and set the headings for the page. While doing so they also store a copy of \markboth in \@mkboth. Therefore we need to check whether \@mkboth has already been set. If so we need to do that again with the new definition of \markboth. (As of Oct 2019, L^AT_EX stores the definition in an intermediate macros, so it's not necessary anymore, but it's preserved for older versions.)

```
499   \ifx\@mkboth\markboth
500     \def\bbl@tempc{\let\@mkboth\markboth}
501   \else
502     \def\bbl@tempc{}
```

```

503 \fi
504 \bbl@ifunset{markboth }\bbl@redefine\bbl@redefineroobust
505 \markboth#1#2{%
506   \protected@edef\bbl@tempb##1{%
507     \protect\foreignlanguage
508       {\language}\protect\bbl@restore@actives##1}}%
509   \bbl@ifblank{#1}%
510     {\toks@{}}%
511     {\toks@\expandafter{\bbl@tempb{#1}}}%
512   \bbl@ifblank{#2}%
513     {\@temptokena{}}%
514     {\@temptokena\expandafter{\bbl@tempb{#2}}}%
515   \bbl@exp{\@org@markboth{\the\toks@}{\the\@temptokena}}
516   \bbl@tempc
517 \fi} % end ifbbl@single, end \IfBabelLayout

```

7.8 Preventing clashes with other packages

7.8.1 ifthen

`\ifthenelse` Sometimes a document writer wants to create a special effect depending on the page a certain fragment of text appears on. This can be achieved by the following piece of code:

```

\ifthenelse{\isodd{\pageref{some:label}}}
  {code for odd pages}
  {code for even pages}

```

In order for this to work the argument of `\isodd` needs to be fully expandable. With the above redefinition of `\pageref` it is not in the case of this example. To overcome that, we add some code to the definition of `\ifthenelse` to make things work. The first thing we need to do is check if the package `ifthen` is loaded. This should be done at `\begin{document}` time.

```

518 \bbl@trace{Preventing clashes with other packages}
519 \bbl@xin@{R}\bbl@opt@safe
520 \ifin@
521   \AtBeginDocument{%
522     \@ifpackageloaded{ifthen}{%

```

Then we can redefine `\ifthenelse`:

```

523   \bbl@redefine@long\ifthenelse#1#2#3{%

```

We want to revert the definition of `\pageref` and `\ref` to their original definition for the first argument of `\ifthenelse`, so we first need to store their current meanings.

```

524   \let\bbl@temp@pref\pageref
525   \let\pageref\org@pageref
526   \let\bbl@temp@ref\ref
527   \let\ref\org@ref

```

Then we can set the `\@safe@actives` switch and call the original `\ifthenelse`. In order to be able to use shorthands in the second and third arguments of `\ifthenelse` the resetting of the switch *and* the definition of `\pageref` happens inside those arguments. When the package wasn't loaded we do nothing.

```

528   \@safe@activestrue
529   \org@ifthenelse{#1}%
530     {\let\pageref\bbl@temp@pref
531      \let\ref\bbl@temp@ref
532      \@safe@activesfalse

```

```

533         #2}%
534         {\let\pageref\bbl@temp@pref
535         \let\ref\bbl@temp@ref
536         \@safe@activesfalse
537         #3}%
538     }%
539 }{}%
540 }

```

7.8.2 varioref

`\@vpageref` When the package `varioref` is in use we need to modify its internal command `\@vpageref`
`\vrefpagenum` in order to prevent problems when an active character ends up in the argument of `\vref`.
`\Ref` The same needs to happen for `\vrefpagenum`.

```

541 \AtBeginDocument{%
542     \ifpackageloaded{varioref}{%
543         \bbl@redefine\@vpageref#1[#2]#3{%
544             \@safe@activetrue
545             \org@@vpageref{#1}[#2]{#3}%
546             \@safe@activesfalse}%
547         \bbl@redefine\vrefpagenum#1#2{%
548             \@safe@activetrue
549             \org@vrefpagenum{#1}{#2}%
550             \@safe@activesfalse}%

```

The package `varioref` defines `\Ref` to be a robust command which uppercases the first character of the reference text. In order to be able to do that it needs to access the expandable form of `\ref`. So we employ a little trick here. We redefine the (internal) command `\Ref` to call `\org@ref` instead of `\ref`. The disadvantage of this solution is that whenever the definition of `\Ref` changes, this definition needs to be updated as well.

```

551     \expandafter\def\csname Ref\endcsname#1{%
552         \protected@edef\@tempa{\org@ref{#1}}\expandafter\MakeUppercase\@tempa}
553     }{}%
554 }
555 \fi

```

7.8.3 hhline

`\hhline` Delaying the activation of the shorthand characters has introduced a problem with the `hhline` package. The reason is that it uses the ‘:’ character which is made active by the french support in `babel`. Therefore we need to *reload* the package when the ‘:’ is an active character.

So at `\begin{document}` we check whether `hhline` is loaded.

```

556 \AtEndOfPackage{%
557     \AtBeginDocument{%
558         \ifpackageloaded{hhline}%

```

Then we check whether the expansion of `\normal@char:` is not equal to `\relax`.

```

559         {\expandafter\ifx\csname normal@char:string\endcsname\relax
560             \else

```

In that case we simply reload the package. Note that this happens *after* the category code of the `@-sign` has been changed to other, so we need to temporarily change it to letter again.

```

561         \makeatletter
562         \def\@currname{hhline}\input{hhline.sty}\makeatother
563         \fi}%
564     {}}}

```

7.8.4 hyperref

`\pdfstringdefDisableCommands` A number of interworking problems between babel and hyperref are tackled by hyperref itself. The following code was introduced to prevent some annoying warnings but it broke bookmarks. This was quickly fixed in hyperref, which essentially made it no-op. However, it will not be removed for the moment because hyperref is expecting it.

```
565 \AtBeginDocument{%
566   \ifx\pdfstringdefDisableCommands\@undefined\else
567     \pdfstringdefDisableCommands{\languageshortands{system}}%
568   \fi}
```

7.8.5 fancyhdr

`\FOREIGNLANGUAGE` The package fancyhdr treats the running head and foot lines somewhat differently as the standard classes. A symptom of this is that the command `\foreignlanguage` which babel adds to the marks can end up inside the argument of `\MakeUpper` case. To prevent unexpected results we need to define `\FOREIGNLANGUAGE` here.

```
569 \DeclareRobustCommand{\FOREIGNLANGUAGE}[1]{%
570   \lowercase{\foreignlanguage{#1}}}
```

`\substitutefontfamily` The command `\substitutefontfamily` creates an .fd file on the fly. The first argument is an encoding mnemonic, the second and third arguments are font family names.

```
571 \def\substitutefontfamily#1#2#3{%
572   \lowercase{\immediate\openout15=#1#2.fd\relax}%
573   \immediate\write15{%
574     \string\ProvidesFile{#1#2.fd}%
575     [\the\year/\two@digits{\the\month}/\two@digits{\the\day}
576     \space generated font description file]^{}
577     \string\DeclareFontFamily{#1}{#2}{}}^{}
578     \string\DeclareFontShape{#1}{#2}{m}{n}{<->ssub * #3/m/n}{}}^{}
579     \string\DeclareFontShape{#1}{#2}{m}{it}{<->ssub * #3/m/it}{}}^{}
580     \string\DeclareFontShape{#1}{#2}{m}{sl}{<->ssub * #3/m/sl}{}}^{}
581     \string\DeclareFontShape{#1}{#2}{m}{sc}{<->ssub * #3/m/sc}{}}^{}
582     \string\DeclareFontShape{#1}{#2}{b}{n}{<->ssub * #3/bx/n}{}}^{}
583     \string\DeclareFontShape{#1}{#2}{b}{it}{<->ssub * #3/bx/it}{}}^{}
584     \string\DeclareFontShape{#1}{#2}{b}{sl}{<->ssub * #3/bx/sl}{}}^{}
585     \string\DeclareFontShape{#1}{#2}{b}{sc}{<->ssub * #3/bx/sc}{}}^{}

587   \closeout15
588 }
```

This command should only be used in the preamble of a document.

```
589 \@onlypreamble\substitutefontfamily
```

7.9 Encoding and fonts

Because documents may use non-ASCII font encodings, we make sure that the logos of \TeX and \LaTeX always come out in the right encoding. There is a list of non-ASCII encodings. Unfortunately, fontenc deletes its package options, so we must guess which encodings has been loaded by traversing `\@filelist` to search for `<enc>enc.def`. If a non-ASCII has been loaded, we define versions of `\TeX` and `\LaTeX` for them using `\ensureascii`. The default ASCII encoding is set, too (in reverse order): the “main” encoding (when the document begins), the last loaded, or OT1.

```
\ensureascii
```

```
590 \bbl@trace{Encoding and fonts}
```

```

591 \newcommand\BabelNonASCII{LGR,X2,OT2,OT3,OT6,LHE,LWN,LMA,LMC,LMS,LMU,PU,PD1}
592 \newcommand\BabelNonText{TS1,T3,TS3}
593 \let\org@TeX\TeX
594 \let\org@LaTeX\LaTeX
595 \let\ensureascii\@firstofone
596 \AtBeginDocument{%
597   \in@false
598   \bbl@foreach\BabelNonASCII{% is there a text non-ascii enc?
599     \ifin@false
600       \lowercase{\bbl@xin@{,#1enc.def,},{, \@filelist,}}%
601     \fi}%
602   \ifin@ % if a text non-ascii has been loaded
603     \def\ensureascii#1{{\fontencoding{OT1}\selectfont#1}}%
604     \DeclareTextCommandDefault{\TeX}{\org@TeX}%
605     \DeclareTextCommandDefault{\LaTeX}{\org@LaTeX}%
606     \def\bbl@tempb#1\@{\uppercase{\bbl@tempc#1}ENC.DEF\@empty\@}%
607     \def\bbl@tempc#1ENC.DEF#2\@{\%
608       \ifx\@empty#2\else
609         \bbl@ifunset{T@#1}%
610         {}%
611         {\bbl@xin@{,#1,},{, \BabelNonASCII, \BabelNonText,}%
612         \ifin@
613           \DeclareTextCommand{\TeX}{#1}{\ensureascii{\org@TeX}}%
614           \DeclareTextCommand{\LaTeX}{#1}{\ensureascii{\org@LaTeX}}%
615         \else
616           \def\ensureascii##1{{\fontencoding{#1}\selectfont##1}}%
617         \fi}%
618       \fi}%
619   \bbl@foreach\@filelist{\bbl@tempb#1\@}% TODO - \@ de mas??
620   \bbl@xin@{,\cf@encoding,},{, \BabelNonASCII, \BabelNonText,}%
621   \ifin@false
622     \edef\ensureascii#1{%
623       \noexpand\fontencoding{\cf@encoding}\noexpand\selectfont#1}}%
624   \fi
625 \fi}

```

Now comes the old deprecated stuff (with a little change in 3.9l, for fontspec). The first thing we need to do is to determine, at `\begin{document}`, which latin fontencoding to use.

`\latinencoding` When text is being typeset in an encoding other than 'latin' (OT1 or T1), it would be nice to still have Roman numerals come out in the Latin encoding. So we first assume that the current encoding at the end of processing the package is the Latin encoding.

```

626 \AtEndOfPackage{\edef\latinencoding{\cf@encoding}}

```

But this might be overruled with a later loading of the package fontenc. Therefore we check at the execution of `\begin{document}` whether it was loaded with the T1 option. The normal way to do this (using `\@ifpackageloaded`) is disabled for this package. Now we have to revert to parsing the internal macro `\@filelist` which contains all the filenames loaded.

```

627 \AtBeginDocument{%
628   \@ifpackageloaded{fontspec}%
629     {\xdef\latinencoding{%
630       \ifx\UTFencname\@undefined
631         EU\ifcase\bbl@engine\or2\or1\fi
632       \else
633         \UTFencname
634       \fi}}%
635     {\gdef\latinencoding{OT1}%

```

```

636 \ifx\cf@encoding\bbl@t@one
637 \xdef\latinencoding{\bbl@t@one}%
638 \else
639 \ifx\@fontenc@load@list\@undefined
640 \@ifl@aded{def}{t1enc}{\xdef\latinencoding{\bbl@t@one}}{}%
641 \else
642 \def\@elt#1{,#1,}%
643 \edef\bbl@tempa{\expandafter\@gobbletwo\@fontenc@load@list}%
644 \let\@elt\relax
645 \bbl@xin@{,T1,}\bbl@tempa
646 \ifin@
647 \xdef\latinencoding{\bbl@t@one}%
648 \fi
649 \fi
650 \fi}}

```

`\latintext` Then we can define the command `\latintext` which is a declarative switch to a latin font-encoding. Usage of this macro is deprecated.

```

651 \DeclareRobustCommand{\latintext}{%
652 \fontencoding{\latinencoding}\selectfont
653 \def\encodingdefault{\latinencoding}}

```

`\textlatin` This command takes an argument which is then typeset using the requested font encoding. In order to avoid many encoding switches it operates in a local scope.

```

654 \ifx\@undefined\DeclareTextFontCommand
655 \DeclareRobustCommand{\textlatin}[1]{\leavevmode{\latintext #1}}
656 \else
657 \DeclareTextFontCommand{\textlatin}{\latintext}
658 \fi

```

7.10 Basic bidi support

Work in progress. This code is currently placed here for practical reasons.

It is loosely based on `rlbabel.def`, but most of it has been developed from scratch. This babel module (by Johannes Braams and Boris Lavva) has served the purpose of typesetting R documents for two decades, and despite its flaws I think it is still a good starting point (some parts have been copied here almost verbatim), partly thanks to its simplicity. I've also looked at ARABI (by Youssef Jabri), which is compatible with babel.

There are two ways of modifying macros to make them “bidi”, namely, by patching the internal low-level macros (which is what I have done with lists, columns, counters, tocs, much like `rlbabel` did), and by introducing a “middle layer” just below the user interface (sectioning, footnotes).

- `pdftex` provides a minimal support for bidi text, and it must be done by hand. Vertical typesetting is not possible.
- `xetex` is somewhat better, thanks to its font engine (even if not always reliable) and a few additional tools. However, very little is done at the paragraph level. Another challenging problem is text direction does not honour \TeX grouping.
- `luatex` can provide the most complete solution, as we can manipulate almost freely the node list, the generated lines, and so on, but bidi text does not work out of the box and some development is necessary. It also provides tools to properly set left-to-right and right-to-left page layouts. As `Lua \TeX -ja` shows, vertical typesetting is possible, too.

```

818 \fi}

```

7.11 Local Language Configuration

`\loadlocalcfg` At some sites it may be necessary to add site-specific actions to a language definition file. This can be done by creating a file with the same name as the language definition file, but with the extension `.cfg`. For instance the file `nor.sk.cfg` will be loaded when the language definition file `nor.sk.ldf` is loaded.

For plain-based formats we don't want to override the definition of `\loadlocalcfg` from `plain.def`.

```

819 \bbl@trace{Local Language Configuration}
820 \ifx\loadlocalcfg\undefined

```

```

821 \ifpackagewith{babel}{noconfigs}%
822 {\let\loadlocalcfg\@gobble}%
823 {\def\loadlocalcfg#1{%
824   \InputIfFileExists{#1.cfg}%
825   {\typeout{*****^J%
826             * Local config file #1.cfg used^^J%
827             *}}}%
828   \@empty}}
829 \fi

```

Just to be compatible with L^AT_EX 2.09 we add a few more lines of code:

```

830 \ifx\@unexpandable@protect\@undefined
831 \def\@unexpandable@protect{\noexpand\protect\noexpand}
832 \long\def\protected@write#1#2#3{%

883 \DeclareOption{polutonikogreek}{%
884   \bbl@try@load@lang{}{greek}{\languageattribute{greek}{polutoniko}}}
885 \DeclareOption{portuguese}{\bbl@try@load@lang{}{portuges}{}}
886 \DeclareOption{russian}{\bbl@try@load@lang{}{russianb}{}}
887 \DeclareOption{ukrainian}{\bbl@try@load@lang{}{ukraineb}{}}
888 \DeclareOption{uppersorbian}{\bbl@try@load@lang{}{usorbian}{}}

```

Another way to extend the list of ‘known’ options for babel was to create the file `bblopts.cfg` in which one can add option declarations. However, this mechanism is deprecated – if you want an alternative name for a language, just create a new `.ldf` file loading the actual one. You can also set the name of the file with the package option `config=<name>`, which will load `<name>.cfg` instead.

```

889 \ifx\bbl@opt@config\@nnil
890   \@ifpackagewith{babel}{noconfigs}{}%
891     {\InputIfFileExists{bblopts.cfg}%
892       {\typeout{*****^J%
893         * Local config file bblopts.cfg used^^J%
894         *}}%
895       {}}%
896 \else
897   \InputIfFileExists{\bbl@opt@config.cfg}%
898     {\typeout{*****^J%
899       * Local config file \bbl@opt@config.cfg used^^J%
900       *}}%
901     {\bbl@error{%
902       Local config file '\bbl@opt@config.cfg' not found}%
903       Perhaps you misspelled it.}%
904 \fi

```

Recognizing global options in packages not having a closed set of them is not trivial, as for them to be processed they must be defined explicitly. So, package options not yet taken into account and stored in `bbbl@language@opts` are assumed to be languages (note this list also contains the language given with `main`). If not declared above, the names of the option and the file are the same.

```

905 \bbl@for\bbl@tempa\bbl@language@opts{%
906   \bbl@ifunset{ds@\bbl@tempa}%
907     {\edef\bbl@tempb{%
908       \noexpand\DeclareOption
909       {\bbl@tempa}%
910       {\noexpand\bbl@load@language{\bbl@tempa}}}%
911     \bbl@tempb}%
912   \@empty}

```

Now, we make sure an option is explicitly declared for any language set as global option, by checking if an `ldf` exists. The previous step was, in fact, somewhat redundant, but that way we minimize accessing the file system just to see if the option could be a language.

```

913 \bbl@foreach\@classoptionslist{%
914   \bbl@ifunset{ds@#1}%
915     {\IfFileExists{#1.ldf}%
916       {\DeclareOption{#1}{\bbl@load@language{#1}}}%
917       {}}%
918   {}}

```

If a main language has been set, store it for the third pass.

```

919 \ifx\bbl@opt@main\@nnil\else
920   \expandafter
921   \let\expandafter\bbl@loadmain\csname ds@\bbl@opt@main\endcsname
922   \DeclareOption{\bbl@opt@main}{}
923 \fi

```

And we are done, because all options for this pass has been declared. Those already processed in the first pass are just ignored.

The options have to be processed in the order in which the user specified them (except, of course, global options, which \LaTeX processes before):

```

924 \def\AfterBabelLanguage#1{%
925   \bbl@ifsamestring\CurrentOption{#1}{\global\bbl@add\bbl@afterlang}{}}
926 \DeclareOption*{}
927 \ProcessOptions*

```

This finished the second pass. Now the third one begins, which loads the main language set with the key main. A warning is raised if the main language is not the same as the last named one, or if the value of the key main is not a language. Then execute directly the option (because it could be used only in main). After loading all languages, we deactivate `\AfterBabelLanguage`.

```

928 \ifx\bbl@opt@main\@nnil
929   \edef\bbl@tempa{\@classoptionslist,\bbl@language@opts}

8 The kernel of Babel (babel.def, common)

The kernel of the babel system is stored in either hyphen.cfg or switch.def and babel.def. The file babel.def contains most of the code, while switch.def defines the language-switching commands; both can be read at run time. The file hyphen.cfg is a file that can be loaded into the format, which is necessary when you want to be able to switch hyphenation patterns (by default, it also inputs switch.def, for “historical reasons”, but it is not necessary). When babel.def is loaded it checks if the current version of switch.def is in the format; if not, it is loaded. A further file, babel.sty, contains L^AT_EX-specific stuff. Because plain T_EX users might want to use some of the features of the babel system too, care has to be taken that plain T_EX can process the files. For this reason the current format will have to be checked in a number of places. Some of the code below is common to plain T_EX and L^AT_EX, some of it is for the L^AT_EX case only. Plain formats based on etex (etex, xetex, luatex) don’t load hyphen.cfg but etex.src, which follows a different naming convention, so we need to define the babel names. It presumes language.def exists and it is the same file used when formats were created.

8.1 Tools

```
962 \ifx\lfd@quit\@undefined
963 \else
964   \expandafter\endinput
965 \fi
966 <<Make sure ProvidesFile is defined>>
967 \ProvidesFile{babel.def}[\<date>] <<version>> Babel common definitions]
968 \ifx\AtBeginDocument\@undefined
969   <<Emulate LaTeX>>
970 \fi
```

The file babel.def expects some definitions made in the L^AT_EX 2_ε style file. So, In L^AT_EX 2.09 and Plain we must provide at least some predefined values as well some tools to set them (even if not all options are available). There are no package options, and therefore an alternative mechanism is provided. For the moment, only \babeloptionstrings and \babeloptionmath are provided, which can be defined before loading babel. \BabelModifiers can be set too (but not sure it works).

```
971 \ifx\bbl@ifshorthand\@undefined
972   \let\bbl@opt@shorthands\@nnil
973   \def\bbl@ifshorthand#1#2#3{#2}%
974   \let\bbl@language@opts\@empty
975   \ifx\babeloptionstrings\@undefined
976     \let\bbl@opt@strings\@nnil
977   \else
978     \let\bbl@opt@strings\babeloptionstrings
979   \fi
980   \def\BabelStringsDefault{generic}
981   \def\bbl@tempa{normal}
982   \ifx\babeloptionmath\bbl@tempa
983     \def\bbl@mathnormal{\noexpand\textormath}
984   \fi
985   \def\AfterBabelLanguage#1#2{}
986   \ifx\BabelModifiers\@undefined\let\BabelModifiers\relax\fi
987   \let\bbl@afterlang\relax
988   \def\bbl@opt@safe{BR}
989   \ifx\@uclclist\@undefined\let\@uclclist\@empty\fi
990   \ifx\bbl@trace\@undefined\def\bbl@trace#1{}\fi
991   \expandafter\newif\csname ifbbl@single\endcsname
992 \fi
```

And continue.

9 Multiple languages (switch.def)

This is not a separate file anymore.

Plain T_EX version 3.0 provides the primitive `\language` that is used to store the current language. When used with a pre-3.0 version this function has to be implemented by allocating a counter.

```
993 <<Define core switching macros>>
```

`\adddialect` The macro `\adddialect` can be used to add the name of a dialect or variant language, for which an already defined hyphenation table can be used.

```
994 \def\bbl@version{<<version>>}%
995 \def\bbl@date{<<date>>}%
996 \def\adddialect#1#2{%
997   \global\chardef#1#2\relax
998   \bbl@usehooks{adddialect}{#1}{#2}}%
999 \begingroup
1000   \count@#1\relax
1001   \def\bbl@elt##1##2##3##4{%
1002     \ifnum\count@=##2\relax
1003       \bbl@info{\string#1 = using hyphenrules for ##1\\%
1004         (\string\language\the\count@)}%
1005       \def\bbl@elt####1####2####3####4{%
1006         \fi}%
1007       \bbl@cs{languages}%
1008     \endgroup}
```

`\bbl@iflanguage` executes code only if the language `l@` exists. Otherwise raises an error. The argument of `\bbl@fixname` has to be a macro name, as it may get “fixed” if casing (`lc/uc`) is wrong. It’s intended to fix a long-standing bug when `\foreignlanguage` and the like appear in a `\MakeXXXcase`. However, a lowercase form is not imposed to improve backward compatibility (perhaps you defined a language named `MYLANG`, but unfortunately mixed case names cannot be trapped). Note `l@` is encapsulated, so that its case does not change.

```
1009 \def\bbl@fixname#1{%
1010   \begingroup
1011   \def\bbl@tempe{l@}%
1012   \edef\bbl@tempd{\noexpand\ifundefined{\noexpand\bbl@tempe#1}}%
1013   \bbl@tempd
1014     {\lowercase\expandafter{\bbl@tempd}%
1015     {\uppercase\expandafter{\bbl@tempd}%
1016     \@empty
1017     {\edef\bbl@tempd{\def\noexpand#1{#1}}%
1018     {\uppercase\expandafter{\bbl@tempd}}}%
1019     {\edef\bbl@tempd{\def\noexpand#1{#1}}%
1020     {\lowercase\expandafter{\bbl@tempd}}}%
1021     \@empty
1022   \edef\bbl@tempd{\endgroup\def\noexpand#1{#1}}%
1023   \bbl@tempd
1024   \bbl@exp{\bbl@usehooks{language}{\language}{#1}}}
1025 \def\bbl@iflanguage#1{%
1026   \ifundefined{l@#1}{\@nolanerr{#1}\@gobble}\@firstofone}
```

After a name has been ‘fixed’, the selectors will try to load the language. If even the fixed name is not defined, will load it on the fly, either based on its name, or if activated, its BCP47 code.

```

1027 \let\bbl@autoload@options\@empty
1028 \def\bbl@provide@locale{%
1029 % Unfinished. To add: search if loaded with \LocaleForEach. Fallbacks
1030 % like fr-FR -> fr.

1050 }%
1051 \fi}%
1052 \fi}

```

`\iflanguage` Users might want to test (in a private package for instance) which language is currently active. For this we provide a test macro, `\iflanguage`, that has three arguments. It checks whether the first argument is a known language. If so, it compares the first argument with the value of `\language`. Then, depending on the result of the comparison, it executes either the second or the third argument.

```

1053 \def\iflanguage#1{%
1054 \bbl@iflanguage{#1}{%
1055 \ifnum\csname l@#1\endcsname=\language
1056 \expandafter\@firstoftwo
1057 \else
1058 \expandafter\@secondoftwo
1059 \fi}}

```

9.1 Selecting the language

`\selectlanguage` The macro `\selectlanguage` checks whether the language is already defined before it performs its actual task, which is to update `\language` and activate language-specific definitions.

To allow the call of `\selectlanguage` either with a control sequence name or with a simple string as argument, we have to use a trick to delete the optional escape character. To convert a control sequence to a string, we use the `\string` primitive. Next we have to look at the first character of this string and compare it with the escape character. Because this escape character can be changed by setting the internal integer `\escapechar` to a character number, we have to compare this number with the character of the string. To do this we have to use T_EX's backquote notation to specify the character as a number. If the first character of the `\string`'ed argument is the current escape character, the comparison has stripped this character and the rest in the 'then' part consists of the rest of the control sequence name. Otherwise we know that either the argument is not a control sequence or `\escapechar` is set to a value outside of the character range 0–255.

If the user gives an empty argument, we provide a default argument for `\string`. This argument should expand to nothing.

```
1060 \let\bbl@select@type\z@
1061 \edef\selectlanguage{%
1062   \noexpand\protect
1063   \expandafter\noexpand\csname selectlanguage \endcsname}
```

Because the command `\selectlanguage` could be used in a moving argument it expands to `\protect\selectlanguage_L`. Therefore, we have to make sure that a macro `\protect` exists. If it doesn't it is `\let` to `\relax`.

```
1064 \ifx\@undefined\protect\let\protect\relax\fi
```

As \LaTeX 2.09 writes to files *expanded* whereas \LaTeX 2_ε takes care *not* to expand the arguments of `\write` statements we need to be a bit clever about the way we add information to .aux files. Therefore we introduce the macro `\xstring` which should expand to the right amount of `\string`'s.

```
1065 \ifx\documentclass\@undefined
1066   \def\xstring{\string\string\string}
1067 \else
1068   \let\xstring\string
1069 \fi
```

Since version 3.5 babel writes entries to the auxiliary files in order to typeset table of contents etc. in the correct language environment.

`\bbl@pop@language` But when the language change happens *inside* a group the end of the group doesn't write anything to the auxiliary files. Therefore we need \TeX 's `aftergroup` mechanism to help us. The command `\aftergroup` stores the token immediately following it to be executed when the current group is closed. So we define a temporary control sequence `\bbl@pop@language` to be executed at the end of the group. It calls `\bbl@set@language` with the name of the current language as its argument.

`\bbl@language@stack` The previous solution works for one level of nesting groups, but as soon as more levels are used it is no longer adequate. For that case we need to keep track of the nested languages using a stack mechanism. This stack is called `\bbl@language@stack` and initially empty.

```
1070 \def\bbl@language@stack{}
```

When using a stack we need a mechanism to push an element on the stack and to retrieve the information afterwards.

`\bbl@push@language` The stack is simply a list of languagenames, separated with a '+' sign; the push function can be simple:

`\bbl@pop@language`

```
1071 \def\bbl@push@language{%
1072   \ifx\language\@undefined\else
1073     \xdef\bbl@language@stack{\language+\bbl@language@stack}%
1074   \fi}
```

Retrieving information from the stack is a little bit less simple, as we need to remove the element from the stack while storing it in the macro `\language`. For this we first define a helper function.

`\bbl@pop@lang` This macro stores its first element (which is delimited by the '+'-sign) in `\language` and stores the rest of the string (delimited by '-') in its third argument.

```
1075 \def\bbl@pop@lang#1+##2##3{%
1076   \edef\language{#1}\xdef#3{#2}}
```

The reason for the somewhat weird arrangement of arguments to the helper function is the fact it is called in the following way. This means that before `\bbl@pop@lang` is executed TeX first *expands* the stack, stored in `\bbl@language@stack`. The result of that is that the argument string of `\bbl@pop@lang` contains one or more language names, each followed by a ‘+’-sign (zero language names won’t occur as this macro will only be called after something has been pushed on the stack) followed by the ‘-’-sign and finally the reference to the stack.

```
1077 \let\bbl@ifrestoring\@secondoftwo
1078 \def\bbl@pop@language{%
1079   \expandafter\bbl@pop@lang\bbl@language@stack&\bbl@language@stack
1080   \let\bbl@ifrestoring\@firstoftwo
1081   \expandafter\bbl@set@language\expandafter{\language}%
1082   \let\bbl@ifrestoring\@secondoftwo}
```

Once the name of the previous language is retrieved from the stack, it is fed to `\bbl@set@language` to do the actual work of switching everything that needs switching.

An alternative way to identify languages (in the babel sense) with a numerical value is introduced in 3.30. This is one of the first steps for a new interface based on the concept of locale, which explains the name of `\localeid`. This means `\l@...` will be reserved for hyphenation patterns.

```
1083 \chardef\localeid\z@
1084 \def\bbl@id@last{0} % No real need for a new counter
1085 \def\bbl@id@assign{%
1086   \bbl@ifunset{bbl@id@@\language}%
1087   {\count@bbl@id@last\relax
1088    \advance\count@\@ne
1089    \bbl@csarg\chardef{id@@\language}\count@
1090    \edef\bbl@id@last{\the\count@}%
1091    \ifcase\bbl@engine\or
1092      \directlua{
1093        Babel = Babel or {}
1094        Babel.locale_props = Babel.locale_props or {}
1095        Babel.locale_props[\bbl@id@last] = {}
1096        Babel.locale_props[\bbl@id@last].name = '\language'
1097      }%
1098    \fi}%
1099   }%
1100   \chardef\localeid\bbl@cl{id@}}
```

The unprotected part of `\selectlanguage`.

```
1101 \expandafter\def\csname selectlanguage \endcsname#1{%
1102   \ifnum\bbl@hymapsel=\@cclv\let\bbl@hymapsel\tw@\fi
1103   \bbl@push@language
1104   \aftergroup\bbl@pop@language
1105   \bbl@set@language{#1}}
```

`\bbl@set@language` The macro `\bbl@set@language` takes care of switching the language environment *and* of writing entries on the auxiliary files. For historical reasons, language names can be either language of `\language`. To catch either form a trick is used, but unfortunately as a side effect the catcodes of letters in `\language` are messed up. This is a bug, but preserved for backwards compatibility. The list of auxiliary files can be extended by redefining `\BabelContentsFiles`, but make sure they are loaded inside a group (as `aux`, `toc`, `lof`, and `lot` do) or the last language of the document will remain active afterwards. We also write a command to change the current language in the auxiliary files.

```
1106 \def\BabelContentsFiles{toc,lof,lot}
1107 \def\bbl@set@language#1{% from selectlanguage, pop@
```

```

1108 % The old buggy way. Preserved for compatibility.

```

A bit of optimization. Select in heads/foots the language only if necessary. The real thing is in `babel.def`.

```
1167 \let\select@language@x\select@language
```

First, check if the user asks for a known language. If so, update the value of `\language` and call `\originalTeX` to bring \TeX in a certain pre-defined state.

The name of the language is stored in the control sequence `\language`.

Then we have to *redefine* `\originalTeX` to compensate for the things that have been activated. To save memory space for the macro definition of `\originalTeX`, we construct the control sequence name for the `\noextras<lang>` command at definition time by expanding the `\csname` primitive.

Now activate the language-specific definitions. This is done by constructing the names of three macros by concatenating three words with the argument of `\selectlanguage`, and calling these macros.

The switching of the values of `\lefthyphenmin` and `\righthyphenmin` is somewhat different. First we save their current values, then we check if `\<lang>hyphenmins` is defined. If it is not, we set default values (2 and 3), otherwise the values in `\<lang>hyphenmins` will be used.

```

1234   \expandafter\expandafter\expandafter\set@hyphenmins
1235   \csname #1hyphenmins\endcsname\relax
1236 \fi}

```

`otherlanguage` The `otherlanguage` environment can be used as an alternative to using the `\selectlanguage` declarative command. When you are typesetting a document which mixes left-to-right and right-to-left typesetting you have to use this environment in order to let things work as you expect them to. The `\ignorespaces` command is necessary to hide the environment when it is entered in horizontal mode.

```

1237 \long\def\otherlanguage#1{%
1238   \ifnum\bbl@hymapsel=\@cclv\let\bbl@hymapsel\thr@\fi
1239   \csname selectlanguage \endcsname{#1}%
1240   \ignorespaces}

```

The `\endotherlanguage` part of the environment tries to hide itself when it is called in horizontal mode.

```

1241 \long\def\endotherlanguage{%
1242   \global\@ignoretrue\ignorespaces}

```

`otherlanguage*` The `otherlanguage` environment is meant to be used when a large part of text from a different language needs to be typeset, but without changing the translation of words such as ‘figure’. This environment makes use of `\foreign@language`.

```

1243 \expandafter\def\csname otherlanguage*\endcsname#1{%
1244   \ifnum\bbl@hymapsel=\@cclv\chardef\bbl@hymapsel4\relax\fi
1245   \foreign@language{#1}}

```

At the end of the environment we need to switch off the extra definitions. The grouping mechanism of the environment will take care of resetting the correct hyphenation rules and “extras”.

```

1246 \expandafter\let\csname endotherlanguage*\endcsname\relax

```

`\foreignlanguage` The `\foreignlanguage` command is another substitute for the `\selectlanguage` command. This command takes two arguments, the first argument is the name of the language to use for typesetting the text specified in the second argument. Unlike `\selectlanguage` this command doesn't switch *everything*, it only switches the hyphenation rules and the extra definitions for the language specified. It does this within a group and assumes the `\extras<lang>` command doesn't make any `\global` changes. The coding is very similar to part of `\selectlanguage`.

`\bbl@beforeforeign` is a trick to fix a bug in bidi texts. `\foreignlanguage` is supposed to be a 'text' command, and therefore it must emit a `\leavevmode`, but it does not, and therefore the indent is placed on the opposite margin. For backward compatibility, however, it is done only if a right-to-left script is requested; otherwise, it is no-op.

(3.11) `\foreignlanguage*` is a temporary, experimental macro for a few lines with a different script direction, while preserving the paragraph format (thank the braces around `\par`, things like `\hangindent` are not reset). Do not use it in production, because its semantics and its syntax may change (and very likely will, or even it could be removed altogether). Currently it enters in vmode and then selects the language (which in turn sets the paragraph direction).

(3.11) Also experimental are the hook `foreign` and `foreign*`. With them you can redefine `\BabelText` which by default does nothing. Its behavior is not well defined yet. So, use it in horizontal mode only if you do not want surprises.

In other words, at the beginning of a paragraph `\foreignlanguage` enters into hmode with the surrounding lang, and with `\foreignlanguage*` with the new lang.

```

1247 \providecommand\bbl@beforeforeign{}

1286 \fi
1287 % set type
1288 \let\bbl@select@type\@ne
1289 \expandafter\bbl@switch\expandafter{\language}}

```

\bbl@patterns This macro selects the hyphenation patterns by changing the `\language` register. If special hyphenation patterns are available specifically for the current font encoding, use them instead of the default.

It also sets hyphenation exceptions, but only once, because they are global (here language `\lccode's` has been set, too). `\bbl@hyphenation@` is set to relax until the very first `\babelhyphenation`, so do nothing with this value. If the exceptions for a language (by its number, not its name, so that `:ENC` is taken into account) has been set, then use `\hyphenation` with both global and language exceptions and empty the latter to mark they must not be set again.

```

1328     \csname\bbl@tempf hyphenmins\endcsname\relax
1329   \fi}}
1330 \let\endhyphenrules\@empty

```

`\providehyphenmins` The macro `\providehyphenmins` should be used in the language definition files to provide a *default* setting for the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`. If the macro `\langhyphenmins` is already defined this command has no effect.

```

1331 \def\providehyphenmins#1#2{%
1332   \expandafter\ifx\csname #1hyphenmins\endcsname\relax
1333     \@namedef{#1hyphenmins}{#2}%
1334   \fi}

```

`\set@hyphenmins` This macro sets the values of `\lefthyphenmin` and `\righthyphenmin`. It expects two values as its argument.

```

1335 \def\set@hyphenmins#1#2{%
1336   \lefthyphenmin#1\relax
1337   \righthyphenmin#2\relax}

```

`\ProvidesLanguage` The identification code for each file is something that was introduced in \LaTeX 2_ϵ . When the command `\ProvidesFile` does not exist, a dummy definition is provided temporarily. For use in the language definition file the command `\ProvidesLanguage` is defined by `babel`. Depending on the format, ie, on if the former is defined, we use a similar definition or not.

```

1338 \ifx\ProvidesFile\@undefined
1339   \def\ProvidesLanguage#1[#2 #3 #4]{%
1340     \wlog{Language: #1 #4 #3 <#2>}%
1341   }
1342 \else
1343   \def\ProvidesLanguage#1{%
1344     \begingroup
1345       \catcode`\ 10 %
1346       \@makeother\%
1347       \@ifnextchar[%]
1348         {\@provideslanguage{#1}}{\@provideslanguage{#1}[]}
1349   \def\@provideslanguage#1[#2]{%
1350     \wlog{Language: #1 #2}%
1351     \expandafter\xdef\csname ver@#1.ldf\endcsname{#2}%
1352     \endgroup}
1353 \fi

```

`\originalTeX` The macro `\originalTeX` should be known to \TeX at this moment. As it has to be expandable we `\let` it to `\@empty` instead of `\relax`.

```

1354 \ifx\originalTeX\@undefined\let\originalTeX\@empty\fi

```

Because this part of the code can be included in a format, we make sure that the macro which initialises the save mechanism, `\babel@beginsave`, is not considered to be undefined.

```

1355 \ifx\babel@beginsave\@undefined\let\babel@beginsave\relax\fi

```

A few macro names are reserved for future releases of babel, which will use the concept of 'locale':

```

1356 \providecommand\setlocale{%
1357   \bbl@error
1358   {Not yet available}%
1359   {Find an armchair, sit down and wait}}
1360 \let\uselocale\setlocale
1361 \let\locale\setlocale
1362 \let\selectlocale\setlocale
1363 \let\localename\setlocale
1364 \let\textlocale\setlocale
1365 \let\textlanguage\setlocale
1366 \let\language\setlocale

```

9.2 Errors

- `\@nolanerr` The babel package will signal an error when a documents tries to select a language that hasn't been defined earlier. When a user selects a language for which no hyphenation patterns were loaded into the format he will be given a warning about that fact. We revert to the patterns for `\language=0` in that case. In most formats that will be (US)english, but it might also be empty.
- `\@nopatterns`
- `\@noopterr` When the package was loaded without options not everything will work as expected. An error message is issued in that case.
 When the format knows about `\PackageError` it must be $\LaTeX 2_{\epsilon}$, so we can safely use its error handling interface. Otherwise we'll have to 'keep it simple'.
 Infos are not written to the console, but on the other hand many people think warnings are errors, so a further message type is defined: an important info which is sent to the console.

```

```

`\addto` For each language four control sequences have to be defined that control the language-specific definitions. To be able to add something to these macro once they have been defined the macro `\addto` is introduced. It takes two arguments, a *<control sequence>* and \TeX -code to be added to the *<control sequence>*.

If the *<control sequence>* has not been defined before it is defined now. The control sequence could also expand to `\relax`, in which case a circular definition results. The net result is a stack overflow. Otherwise the replacement text for the *<control sequence>* is expanded and stored in a token register, together with the \TeX -code to be added. Finally the *<control sequence>* is redefined, using the contents of the token register.

```

1477 \def\addto#1#2{%
1478   \ifx#1\@undefined
1479     \def#1{#2}%
1480   \else
1481     \ifx#1\relax

1483     \else
1484       {\toks@\expandafter{#1#2}%
1485        \xdef#1{\the\toks@}}%
1486   \fi
1487 \fi}

```

The macro `\initiate@active@char` takes all the necessary actions to make its argument a shorthand character. The real work is performed once for each character.

```

1488 \def\bbl@withactive#1#2{%
1489   \begingroup
1490     \lccode`~=#2\relax
1491     \lowercase{\endgroup#1~}}

```

`\bbl@redefine` To redefine a command, we save the old meaning of the macro. Then we redefine it to call the original macro with the ‘sanitized’ argument. The reason why we do it this way is that we don’t want to redefine the \LaTeX macros completely in case their definitions change (they have changed in the past).

Because we need to redefine a number of commands we define the command `\bbl@redefine` which takes care of this. It creates a new control sequence, `\org@...`

```
1492 \def\bbl@redefine#1{%
1493   \edef\bbl@tempa{\bbl@stripslash#1}%
1494   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1495   \expandafter\def\csname\bbl@tempa\endcsname}
```

This command should only be used in the preamble of the document.

```
1496 \@onlypreamble\bbl@redefine
```

`\bbl@redefine@long` This version of `\babel@redefine` can be used to redefine `\long` commands such as `\ifthenelse`.

```
1497 \def\bbl@redefine@long#1{%
1498   \edef\bbl@tempa{\bbl@stripslash#1}%
1499   \expandafter\let\csname org@\bbl@tempa\endcsname#1%
1500   \expandafter\long\expandafter\def\csname\bbl@tempa\endcsname}
1501 \@onlypreamble\bbl@redefine@long
```

`\bbl@redefineroobust` For commands that are redefined, but which *might* be robust we need a slightly more intelligent macro. A robust command `foo` is defined to expand to `\protect\foo_`. So it is necessary to check whether `\foo_` exists. The result is that the command that is being redefined is always robust afterwards. Therefore all we need to do now is define `\foo_`.

```
1502 \def\bbl@redefineroobust#1{%
1503   \edef\bbl@tempa{\bbl@stripslash#1}%
1504   \bbl@ifunset{\bbl@tempa\space}%
1505   {\expandafter\let\csname org@\bbl@tempa\endcsname#1%
1506     \bbl@exp{\def\#1{\protect\<\bbl@tempa\space>}}}%
1507   {\bbl@exp{\let\<org@\bbl@tempa\<\bbl@tempa\space>}}}%
1508   \@namedef{\bbl@tempa\space}}
```

This command should only be used in the preamble of the document.

```
1509 \@onlypreamble\bbl@redefineroobust
```

9.3 Hooks

Note they are loaded in `babel.def`. `switch.def` only provides a “hook” for hooks (with a default value which is a no-op, below). Admittedly, the current implementation is a somewhat simplistic and does very little to catch errors, but it is intended for developers, after all. `\bbl@usehooks` is the commands used by `babel` to execute hooks defined for an event.

```
1510 \bbl@trace{Hooks}
1511 \newcommand\AddBabelHook[3][{}]{%
1512   \bbl@ifunset{bbl@hk@#2}{\EnableBabelHook{#2}}}%
1513   \def\bbl@tempa##1,#3=##2,##3\@empty{\def\bbl@tempb{##2}}}%
1514   \expandafter\bbl@tempa\bbl@evargs,#3=,\@empty
1515   \bbl@ifunset{bbl@ev@#2@#3@#1}%
1516     {\bbl@csarg\bbl@add{ev@#3@#1}{\bbl@elt{#2}}}%
1517     {\bbl@csarg\let{ev@#2@#3@#1}\relax}%
1518   \bbl@csarg\newcommand{ev@#2@#3@#1}{\bbl@tempb}}
1519 \newcommand\EnableBabelHook[1]{\bbl@csarg\let{hk@#1}\@firstofone}
1520 \newcommand\DisableBabelHook[1]{\bbl@csarg\let{hk@#1}\@gobble}
1521 \def\bbl@usehooks#1#2{%
1522   \def\bbl@elt##1{%
1523     \bbl@cs{hk@##1}{\bbl@cs{ev@##1@#1@#2}}}%
1524   \bbl@cs{ev@#1@}%
1525   \ifx\language\undefined\else % Test required for Plain (?)
```

```

1526 \def\bbl@elt##1{%
1527 \bbl@cs{hk@##1}{\bbl@cl{ev@##1@#1}#2}}%
1528 \bbl@cl{ev@#1}%
1529 \fi}

```

To ensure forward compatibility, arguments in hooks are set implicitly. So, if a further argument is added in the future, there is no need to change the existing code. Note events intended for hyphen.cfg are also loaded (just in case you need them for some reason).

```

1530 \def\bbl@evargs{% <- don't delete this comma
1531 everylanguage=1,loadkernel=1,loadpatterns=1,loadexceptions=1,%
1532 adddialect=2,patterns=2,defaultcommands=0,encodedcommands=2,write=0,%
1533 beforeextras=0,afterextras=0,stopcommands=0,stringprocess=0,%
1534 hyphenation=2,initiateactive=3,afterreset=0,foreign=0,foreign*=0,%
1535 beforestart=0,language=2}

```

`\babelensure` The user command just parses the optional argument and creates a new macro named `\bbl@e@<language>`. We register a hook at the `afterextras` event which just executes this macro in a “complete” selection (which, if undefined, is `\relax` and does nothing). This part is somewhat involved because we have to make sure things are expanded the correct number of times.

The macro `\bbl@e@<language>` contains `\bbl@ensure{<include>}{<exclude>}{<fontenc>}`, which in turn loops over the macros names in `\bbl@captionslist`, excluding (with the help of `\in@`) those in the exclude list. If the fontenc is given (and not `\relax`), the `\fontencoding` is also added. Then we loop over the include list, but if the macro already contains `\foreignlanguage`, nothing is done. Note this macro (1) is not restricted to the preamble, and (2) changes are local.

```

9.4 Setting up language files

`\LdfInit` The second version of `\LdfInit` macro takes two arguments. The first argument is the name of the language that will be defined in the language definition file; the second argument is either a control sequence or a string from which a control sequence should be constructed. The existence of the control sequence indicates that the file has been processed before.

At the start of processing a language definition file we always check the category code of the at-sign. We make sure that it is a ‘letter’ during the processing of the file. We also save its name as the last called option, even if not loaded.

Another character that needs to have the correct category code during processing of language definition files is the equals sign, ‘=’, because it is sometimes used in constructions with the `\let` primitive. Therefore we store its current catcode and restore it later on. Now we check whether we should perhaps stop the processing of this file. To do this we first need to check whether the second argument that is passed to `\LdfInit` is a control sequence. We do that by looking at the first token after passing #2 through string. When it is equal to `@backslashchar` we are dealing with a control sequence which we can compare with `@undefined`.

If so, we call `\ldf@quit` to set the main language, restore the category code of the @-sign and call `\endinput`

When #2 was *not* a control sequence we construct one and compare it with `\relax`.

Finally we check `\originalTeX`.

```

1673   \fi}
```

9.5 Shorthands

`\bbl@add@special` The macro `\bbl@add@special` is used to add a new character (or single character control sequence) to the macro `\dospecials` (and `\@sanitize` if `LaTeX` is used). It is used only at one place, namely when `\initiate@active@char` is called (which is ignored if the char has been made active before). Because `\@sanitize` can be undefined, we put the definition inside a conditional.

Items are added to the lists without checking its existence or the original catcode. It does not hurt, but should be fixed. It's already done with `\nfss@catcodes`, added in 3.10.

```
1674 \bbl@trace{Shorthands}
1675 \def\bbl@add@special#1{% 1:a macro like \", \?, etc.
1676   \bbl@add\dospecials{\do#1}% test @sanitize = \relax, for back. compat.
1677   \bbl@ifunset{@sanitize}{\bbl@add@sanitize{\@makeother#1}}%
1678   \ifx\nfss@catcodes\@undefined\else % TODO - same for above
1679     \begingroup
1680       \catcode`#1\active
1681       \nfss@catcodes
1682       \ifnum\catcode`#1=\active
1683         \endgroup
1684       \bbl@add\nfss@catcodes{\@makeother#1}%
1685     \endgroup
1686   }
```

```

1685     \else
1686     \endgroup
1687     \fi
1688 \fi}

```

`\bbl@remove@special` The companion of the former macro is `\bbl@remove@special`. It removes a character from the set macros `\dospecials` and `\@sanitize`, but it is not used at all in the babel core.

```

1689 \def\bbl@remove@special#1{%
1690   \begingroup
1691   \def\x##1##2{\ifnum`#1=`##2\noexpand\@empty

1698       \def\noexpand\@sanitize{\@sanitize}%
1699     \fi}%
1700   \x}

```

`\initiate@active@char` A language definition file can call this macro to make a character active. This macro takes one argument, the character that is to be made active. When the character was already active this macro does nothing. Otherwise, this macro defines the control sequence `\normal@char⟨char⟩` to expand to the character in its ‘normal state’ and it defines the active character to expand to `\normal@char⟨char⟩` by default (`⟨char⟩` being the character to be made active). Later its definition can be changed to expand to `\active@char⟨char⟩` by calling `\bbl@activate{⟨char⟩}`.

For example, to make the double quote character active one could have `\initiate@active@char{"}` in a language definition file. This defines " as `\active@prefix "\active@char` (where the first " is the character with its original catcode, when the shorthand is created, and `\active@char` is a single token). In protected contexts, it expands to `\protect "` or `\noexpand "` (ie, with the original "); otherwise `\active@char` is executed. This macro in turn expands to `\normal@char` in “safe” contexts (eg, `\label`), but `\user@active` in normal “unsafe” ones. The latter search a definition in the user, language and system levels, in this order, but if none is found, `\normal@char` is used. However, a deactivated shorthand (with `\bbl@deactivate` is defined as `\active@prefix "\normal@char`.

The following macro is used to define shorthands in the three levels. It takes 4 arguments: the (string’ed) character, `\<level>@group`, `<level>@active` and `<next-level>@active` (except in system).

```

1701 \def\bbl@active@def#1#2#3#4{%
1702   \@namedef{#3#1}{%
1703     \expandafter\ifx\csname#2@sh@#1\endcsname\relax
1704       \bbl@afterelse\bbl@sh@select#2#1{#3@arg#1}{#4#1}%
1705     \else
1706       \bbl@afterfi\csname#2@sh@#1\endcsname
1707     \fi}%

```

When there is also no current-level shorthand with an argument we will check whether there is a next-level defined shorthand for this active character.

```

1708   \long\@namedef{#3@arg#1}##1{%
1709     \expandafter\ifx\csname#2@sh@#1@string##1\endcsname\relax
1710       \bbl@afterelse\csname#4#1\endcsname##1%
1711     \else
1712       \bbl@afterfi\csname#2@sh@#1@string##1\endcsname
1713     \fi}}%

```

\initiate@active@char calls \@initiate@active@char with 3 arguments. All of them are the same character with different catcodes: active, other (\string'ed) and the original one. This trick simplifies the code a lot.

```
1714 \def\initiate@active@char#1{%
1715   \bbl@ifunset{active@char\string#1}%
1716   {\bbl@withactive
1717    {\expandafter\@initiate@active@char\expandafter}#1\string#1}%
1718   {}}
```

The very first thing to do is saving the original catcode and the original definition, even if not active, which is possible (undefined characters require a special treatment to avoid making them \relax).

```
1719 \def\@initiate@active@char#1#2#3{%
1720   \bbl@csarg\edef{oricat@#2}{\catcode`#2=\the\catcode`#2\relax}%
1721   \ifx#1\undefined
1722     \bbl@csarg\edef{oridef@#2}{\let\noexpand#1\noexpand\@undefined}%
1723   \else
1724     \bbl@csarg\let{oridef@#2}#1%
1725     \bbl@csarg\edef{oridef@#2}{%
1726       \let\noexpand#1%
1727       \expandafter\noexpand\csname bbl@oridef@@#2\endcsname}%
1728   \fi
```

If the character is already active we provide the default expansion under this shorthand mechanism. Otherwise we write a message in the transcript file, and define \normal@char<char> to expand to the character in its default state. If the character is mathematically active when babel is loaded (for example ') the normal expansion is somewhat different to avoid an infinite loop (but it does not prevent the loop if the mathcode is set to "8000 *a posteriori*").

```
1729   \ifx#1#3\relax
1730     \expandafter\let\csname normal@char#2\endcsname#3%
1731   \else
1732     \bbl@info{Making #2 an active character}%
1733     \ifnum\mathcode`#2=\ifodd\bbl@engine"1000000 \else"8000 \fi
1734     \@namedef{normal@char#2}{%
1735       \textormath{#3}{\csname bbl@oridef@@#2\endcsname}}%
1736   \else
1737     \@namedef{normal@char#2}{#3}%
1738   \fi
```

To prevent problems with the loading of other packages after babel we reset the catcode of the character to the original one at the end of the package and of each language file (except with KeepShorthandsActive). It is re-activate again at \begin{document}. We also need to make sure that the shorthands are active during the processing of the .aux file. Otherwise some citations may give unexpected results in the printout when a shorthand was used in the optional argument of \bibitem for example. Then we make it active (not strictly necessary, but done for backward compatibility).

```
1739   \bbl@restoreactive{#2}%
1740   \AtBeginDocument{%
1741     \catcode`#2\active
1742     \if@filesw
1743       \immediate\write\@mainaux{\catcode`\string#2\active}%
1744     \fi}%
1745   \expandafter\bbl@add@special\csname#2\endcsname
1746   \catcode`#2\active
1747   \fi
```

Now we have set `\normal@char⟨char⟩`, we must define `\active@char⟨char⟩`, to be executed when the character is activated. We define the first level expansion of `\active@char⟨char⟩` to check the status of the `@safe@actives` flag. If it is set to true we expand to the ‘normal’ version of this character, otherwise we call `\user@active⟨char⟩` to start the search of a definition in the user, language and system levels (or eventually `normal@char⟨char⟩`).

```

1748 \let\bbl@tempa\@firstoftwo
1749 \if\string^#2%
1750   \def\bbl@tempa{\noexpand\textormath}%
1751 \else
1752   \ifx\bbl@mathnormal\@undefined\else
1753     \let\bbl@tempa\bbl@mathnormal
1754   \fi
1755 \fi
1756 \expandafter\edef\csname active@char#2\endcsname{%
1757   \bbl@tempa
1758     {\noexpand\if@safe@actives
1759       \noexpand\expandafter
1760       \expandafter\noexpand\csname normal@char#2\endcsname
1761     \noexpand\else
1762       \noexpand\expandafter
1763       \expandafter\noexpand\csname bbl@doactive#2\endcsname
1764     \noexpand\fi}%
1765   {\expandafter\noexpand\csname normal@char#2\endcsname}}%
1766 \bbl@csarg\edef{doactive#2}{%
1767   \expandafter\noexpand\csname user@active#2\endcsname}%

```

We now define the default values which the shorthand is set to when activated or deactivated. It is set to the deactivated form (globally), so that the character expands to

`\active@prefix⟨char⟩ \normal@char⟨char⟩`

(where `\active@char⟨char⟩` is *one* control sequence!).

```

1768 \bbl@csarg\edef{active@#2}{%
1769   \noexpand\active@prefix\noexpand#1%
1770   \expandafter\noexpand\csname active@char#2\endcsname}%
1771 \bbl@csarg\edef{normal@#2}{%
1772   \noexpand\active@prefix\noexpand#1%
1773   \expandafter\noexpand\csname normal@char#2\endcsname}%
1774 \expandafter\let\expandafter#1\csname bbl@normal@#2\endcsname

```

The next level of the code checks whether a user has defined a shorthand for himself with this character. First we check for a single character shorthand. If that doesn’t exist we check for a shorthand with an argument.

```

1775 \bbl@active@def#2\user@group{user@active}{language@active}%
1776 \bbl@active@def#2\language@group{language@active}{system@active}%
1777 \bbl@active@def#2\system@group{system@active}{normal@char}%

```

In order to do the right thing when a shorthand with an argument is used by itself at the end of the line we provide a definition for the case of an empty argument. For that case we let the shorthand character expand to its non-active self. Also, When a shorthand combination such as ‘ ’ ends up in a heading \TeX would see `\protect'\protect'`. To prevent this from happening a couple of shorthand needs to be defined at user level.

```

1778 \expandafter\edef\csname\user@group @sh@#2@@\endcsname
1779   {\expandafter\noexpand\csname normal@char#2\endcsname}%
1780 \expandafter\edef\csname\user@group @sh@#2@\string\protect@\endcsname
1781   {\expandafter\noexpand\csname user@active#2\endcsname}%

```

Finally, a couple of special cases are taken care of. (1) If we are making the right quote (‘) active we need to change `\pr@m@s` as well. Also, make sure that a single ‘ in math mode

‘does the right thing’. (2) If we are using the caret (^) as a shorthand character special care should be taken to make sure math still works. Therefore an extra level of expansion is introduced with a check for math mode on the upper level.

```
1782 \if\string'#2%
1783 \let\prim@s\bbl@prim@s
1784 \let\active@math@prime#1%
1785 \fi
1786 \bbl@usehooks{initiateactive}{\#1}{\#2}{\#3}}
```

The following package options control the behavior of shorthands in math mode.

```
1787 <<More package options>> ≡
1788 \DeclareOption{math=active}{}
1789 \DeclareOption{math=normal}{\def\bbl@mathnormal{\noexpand\textormath}}
1790 <</More package options>>
```

Initiating a shorthand makes active the char. That is not strictly necessary but it is still done for backward compatibility. So we need to restore the original catcode at the end of package *and* and the end of the *ldf*.

```
1791 \@ifpackagewith{babel}{KeepShorthandsActive}%
1792 {\let\bbl@restoreactive\@gobble}%
1793 {\def\bbl@restoreactive#1{%
1794   \bbl@exp{%
1795     \\\AfterBabelLanguage\\CurrentOption
1796     {\catcode`#1=\the\catcode`#1\relax}%
1797     \\\AtEndOfPackage
1798     {\catcode`#1=\the\catcode`#1\relax}}}%
1799   \AtEndOfPackage{\let\bbl@restoreactive\@gobble}}
```

\bbl@sh@select This command helps the shorthand supporting macros to select how to proceed. Note that this macro needs to be expandable as do all the shorthand macros in order for them to work in expansion-only environments such as the argument of `\hyphenation`. This macro expects the name of a group of shorthands in its first argument and a shorthand character in its second argument. It will expand to either `\bbl@firstcs` or `\bbl@scndcs`. Hence two more arguments need to follow it.

```
1800 \def\bbl@sh@select#1#2{%
1801   \expandafter\ifx\csname#1@sh@#2@sel\endcsname\relax
1802     \bbl@afterelse\bbl@scndcs
1803   \else
1804     \bbl@afterfi\csname#1@sh@#2@sel\endcsname
1805   \fi}
```

\active@prefix The command `\active@prefix` which is used in the expansion of active characters has a function similar to `\OT1-cmd` in that it `\protect`s the active character whenever `\protect` is *not* `\@typeset@protect`. The `\@gobble` is needed to remove a token such as `\activechar`: (when the double colon was the active character to be dealt with). There are two definitions, depending of `\ifincsname` is available. If there is, the expansion will be more robust.

```
1806 \begingroup
1807 \bbl@ifunset{ifincsname}%
1808 {\gdef\active@prefix#1{%
1809   \ifx\protect\@typeset@protect
1810     \else
1811       \ifx\protect\@unexpandable@protect
1812         \noexpand#1%
1813       \else
1814         \protect#1%
1815       \fi
```

```

1816     \expandafter\@gobble

1833 \endgroup

```

`\if@safe@actives` In some circumstances it is necessary to be able to change the expansion of an active character on the fly. For this purpose the switch `@safe@actives` is available. The setting of this switch should be checked in the first level expansion of `\active@char⟨char⟩`.

```

1834 \newif\if@safe@actives
1835 \@safe@activesfalse

```

`\bbl@restore@actives` When the output routine kicks in while the active characters were made “safe” this must be undone in the headers to prevent unexpected typeset results. For this situation we define a command to make them “unsafe” again.

```

1836 \def\bbl@restore@actives{\if@safe@actives\@safe@activesfalse\fi}

```

`\bbl@activate` Both macros take one argument, like `\initiate@active@char`. The macro is used to change the definition of an active character to expand to `\active@char⟨char⟩` in the case of `\bbl@activate`, or `\normal@char⟨char⟩` in the case of `\bbl@deactivate`.

```

1837 \def\bbl@activate#1{%
1838     \bbl@withactive{\expandafter\let\expandafter}#1%
1839     \csname bbl@active@\string#1\endcsname}
1840 \def\bbl@deactivate#1{%
1841     \bbl@withactive{\expandafter\let\expandafter}#1%
1842     \csname bbl@normal@\string#1\endcsname}

```

`\bbl@firstcs` These macros have two arguments. They use one of their arguments to build a control sequence from.

```

1843 \def\bbl@firstcs#1#2{\csname#1\endcsname}
1844 \def\bbl@scndcs#1#2{\csname#2\endcsname}

```

`\declare@shorthand` The command `\declare@shorthand` is used to declare a shorthand on a certain level. It takes three arguments:

1. a name for the collection of shorthands, i.e. ‘system’, or ‘dutch’;
2. the character (sequence) that makes up the shorthand, i.e. ~ or "a;
3. the code to be executed when the shorthand is encountered.

```

1845 \def\declare@shorthand#1#2{\@decl@short{#1}#2\@nil}
1846 \def\@decl@short#1#2#3\@nil#4{%
1847     \def\bbl@tempa{#3}%
1848     \ifx\bbl@tempa\@empty

```

```

1849 \expandafter\let\csname #1@sh@\string#2@sel\endcsname\bb1@scndcs
1850 \bb1@ifunset{#1@sh@\string#2@}{}%
1851 {\def\bb1@tempa{#4}%
1852 \expandafter\ifx\csname#1@sh@\string#2@\endcsname\bb1@tempa
1853 \else
1854 \bb1@info

1867 in language \CurrentOption}%
1868 \fi}%
1869 \@namedef{#1@sh@\string#2@\string#3@}{#4}%
1870 \fi}

```

`\textormath` Some of the shorthands that will be declared by the language definition files have to be usable in both text and mathmode. To achieve this the helper macro `\textormath` is provided.

```

1871 \def\textormath{%
1872 \ifmmode
1873 \expandafter\@secondoftwo
1874 \else
1875 \expandafter\@firstoftwo
1876 \fi}

```

`\user@group` The current concept of ‘shorthands’ supports three levels or groups of shorthands. For each level the name of the level or group is stored in a macro. The default is to have a user group; use language group ‘english’ and have a system group called ‘system’.

```

1877 \def\user@group{user}
1878 \def\language@group{english}
1879 \def\system@group{system}

```

`\useshorthands` This is the user level command to tell \TeX that user level shorthands will be used in the document. It takes one argument, the character that starts a shorthand. First note that this is user level, and then initialize and activate the character for use as a shorthand character (ie, it’s active in the preamble). Languages can deactivate shorthands, so a starred version is also provided which activates them always after the language has been switched.

```

1880 \def\useshorthands{%
1881 \@ifstar\bb1@usesh@s{\bb1@usesh@x{}}
1882 \def\bb1@usesh@s#1{%

1894   {Sorry, but you cannot use shorthands which have been\\%
1895     turned off in the package options}}}

```

`\defineshorthand` Currently we only support two groups of user level shorthands, named internally `user` and `user@<lang>` (language-dependent user shorthands). By default, only the first one is taken into account, but if the former is also used (in the optional argument of `\defineshorthand`) a new level is inserted for it (`user@generic`, done by `\bbl@set@user@generic`); we make also sure `{}` and `\protect` are taken into account in this new top level.

```

1896 \def\user@language@group{user@\language@group}
1897 \def\bbl@set@user@generic#1#2{%
1898   \bbl@ifunset{user@generic@active#1}%
1899   {\bbl@active@def#1\user@language@group{user@active}{user@generic@active}%
1900     \bbl@active@def#1\user@group{user@generic@active}{language@active}%
1901     \expandafter\edef\csname#2@sh@#1@@\endcsname{%
1902       \expandafter\noexpand\csname normal@char#1\endcsname}%
1903     \expandafter\edef\csname#2@sh@#1@\string\protect@\endcsname{%
1904       \expandafter\noexpand\csname user@active#1\endcsname}}%
1905   \@empty}
1906 \newcommand\defineshorthand[3][user]{%
1907   \edef\bbl@tempa{\zap@space#1 \@empty}%

1914     \declare@shorthand{\bbl@tempb}{#2}{#3}}}

```

`\languageshorthands` A user level command to change the language from which shorthands are used. Unfortunately, `babel` currently does not keep track of defined groups, and therefore there is no way to catch a possible change in casing.

```

1915 \def\languageshorthands#1{\def\language@group{#1}}

```

`\aliasshorthand` First the new shorthand needs to be initialized,

```

1916 \def\aliasshorthand#1#2{%
1917   \bbl@ifshorthand{#2}%
1918   {\expandafter\ifx\csname active@char\string#2\endcsname\relax
1919     \ifx\document\@notprerr
1920       \@notshorthand{#2}%
1921     \else
1922       \initiate@active@char{#2}%

```

Then, we define the new shorthand in terms of the original one, but note with `\aliasshorthands{"}{/}` is `\active@prefix / \active@char /`, so we still need to let the latest to `\active@char`.

```

1923     \expandafter\let\csname active@char\string#2\endcsname
1924       \csname active@char\string#1\endcsname
1925     \expandafter\let\csname normal@char\string#2\endcsname
1926       \csname normal@char\string#1\endcsname
1927     \bbl@activate{#2}%
1928   \fi
1929 \fi}%
1930 {\bbl@error

1938     the preamble.\%
1939     I will ignore your instruction}%
1940   {You may proceed, but expect unexpected results}}
```

\shorthandon The first level definition of these macros just passes the argument on to \bbl@switch@sh,
\shorthandoff adding \@nil at the end to denote the end of the list of characters.

```
1941 \newcommand*\shorthandon[1]{\bbl@switch@sh\@ne#1\@nnil}
1942 \DeclareRobustCommand*\shorthandoff{%
1943   \@ifstar{\bbl@shorthandoff\tw@}{\bbl@shorthandoff\z@}}
1944 \def\bbl@shorthandoff#1#2{\bbl@switch@sh#1#2\@nnil}
```

\bbl@switch@sh The macro \bbl@switch@sh takes the list of characters apart one by one and subsequently switches the category code of the shorthand character according to the first argument of \bbl@switch@sh.

But before any of this switching takes place we make sure that the character we are dealing with is known as a shorthand character. If it is, a macro such as \active@char" should exist.

Switching off and on is easy – we just set the category code to ‘other’ (12) and \active.

With the starred version, the original catcode and the original definition, saved in @initiate@active@char, are restored.

```
1945 \def\bbl@switch@sh#1#2{%
1946   \ifx#2\@nnil\else
1947     \bbl@ifunset{\bbl@active@\string#2}%

2005       {\bbl@if@primes*^\pr@@@t\egroup}}}
2006 \endgroup

```

Usually the `~` is active and expands to `\penalty\@M_{}`. When it is written to the `.aux` file it is written expanded. To prevent that and to be able to use the character `~` as a start character for a shorthand, it is redefined here as a one character shorthand on system level. The system declaration is in most cases redundant (when `~` is still a non-break space), and in some cases is inconvenient (if `~` has been redefined); however, for backward compatibility it is maintained (some existing documents may rely on the babel value).

```

2007 \initiate@active@char{~}
2008 \declare@shorthand{system}{~}{\leavevmode\nobreak\ }
2009 \bbl@activate{~}

```

\OT1dqpos The position of the double quote character is different for the OT1 and T1 encodings. It will later be selected using the `\f@encoding` macro. Therefore we define two macros here to store the position of the character in these encodings.

\T1dqpos

```

2010 \expandafter\def\csname OT1dqpos\endcsname{127}
2011 \expandafter\def\csname T1dqpos\endcsname{4}

```

When the macro `\f@encoding` is undefined (as it is in plain \TeX) we define it here to expand to OT1

```
2012 \ifx\f@encoding\@undefined
2013   \def\f@encoding{OT1}
2014 \fi
```

9.6 Language attributes

Language attributes provide a means to give the user control over which features of the language definition files he wants to enable.

`\languageattribute` The macro `\languageattribute` checks whether its arguments are valid and then activates the selected language attribute. First check whether the language is known, and then process each attribute in the list.

```
2015 \bbl@trace{Language attributes}
2016 \newcommand\languageattribute[2]{%
2017   \def\bbl@tempc{#1}%
2018   \bbl@fixname\bbl@tempc
2019   \bbl@iflanguage\bbl@tempc{%
2020     \bbl@vforeach{#2}{%
```

We want to make sure that each attribute is selected only once; therefore we store the already selected attributes in `\bbl@known@attrs`. When that control sequence is not yet defined this attribute is certainly not selected before.

```
2021     \ifx\bbl@known@attrs\@undefined
2022       \in@false
2023     \else
2024       \bbl@xin@{,\bbl@tempc-##1,}{,\bbl@known@attrs,}%
2025     \fi
2026     \ifin@
2027       \bbl@warning{%
2028         You have more than once selected the attribute '##1'\%
2029         for language #1. Reported}%
2030     \else
```

When we end up here the attribute is not selected before. So, we add it to the list of selected attributes and execute the associated \TeX -code.

```
2031       \bbl@exp{%
2032         \\bbl@add@list\\bbl@known@attrs{\bbl@tempc-##1}}%
2033       \edef\bbl@tempa{\bbl@tempc-##1}%
2034       \expandafter\bbl@ifknown@ttrib\expandafter{\bbl@tempa}\bbl@attributes%
2035       {\csname\bbl@tempc @attr##1\endcsname}%
2036       {\@attrerr{\bbl@tempc}{##1}}%
2037     \fi}}
```

This command should only be used in the preamble of a document.

```
2038 \@onlypreamble\languageattribute
```

The error text to be issued when an unknown attribute is selected.

```
2039 \newcommand*{\@attrerr}[2]{%
2040   \bbl@error
2041   {The attribute #2 is unknown for language #1.}%
2042   {Your command will be ignored, type <return> to proceed}}
```

`\bbl@declare@ttribute` This command adds the new language/attribute combination to the list of known attributes.

Then it defines a control sequence to be executed when the attribute is used in a document. The result of this should be that the macro `\extras...` for the current

language is extended, otherwise the attribute will not work as its code is removed from memory at `\begin{document}`.

```
2043 \def\bbl@declare@ttribute#1#2#3{%
2044   \bbl@xin@{,#2,}{,\BabelModifiers,}%
2045   \ifin@
2046     \AfterBabelLanguage{#1}{\languageattribute{#1}{#2}}%
2047   \fi
2048   \bbl@add@list\bbl@attributes{#1-#2}%
2049   \expandafter\def\csname#1@attr@#2\endcsname{#3}}
```

`\bbl@ifattributeset` This internal macro has 4 arguments. It can be used to interpret \TeX code based on whether a certain attribute was set. This command should appear inside the argument to `\AtBeginDocument` because the attributes are set in the document preamble, *after* babel is loaded.

The first argument is the language, the second argument the attribute being checked, and the third and fourth arguments are the true and false clauses.

```
2050 \def\bbl@ifattributeset#1#2#3#4{%
```

First we need to find out if any attributes were set; if not we're done.

```
2051   \ifx\bbl@known@attribs\@undefined
2052     \in@false
2053   \else
```

The we need to check the list of known attributes.

```
2054     \bbl@xin@{,#1-#2,}{,\bbl@known@attribs,}%
2055   \fi
```

When we're this far `\ifin@` has a value indicating if the attribute in question was set or not. Just to be safe the code to be executed is 'thrown over the `\fi`'.

```
2056   \ifin@
2057     \bbl@afterelse#3%
2058   \else
2059     \bbl@afterfi#4%
2060   \fi
2061 }
```

`\bbl@ifknown@ttrib` An internal macro to check whether a given language/attribute is known. The macro takes 4 arguments, the language/attribute, the attribute list, the \TeX -code to be executed when the attribute is known and the \TeX -code to be executed otherwise.

```
2062 \def\bbl@ifknown@ttrib#1#2{%
```

We first assume the attribute is unknown.

```
2063   \let\bbl@tempa\@secondoftwo
```

Then we loop over the list of known attributes, trying to find a match.

```
2064   \bbl@loopx\bbl@tempb{#2}{%
2065     \expandafter\in@\expandafter{\expandafter,\bbl@tempb,}{,#1,}%
2066   \ifin@
```

When a match is found the definition of `\bbl@tempa` is changed.

```
2067     \let\bbl@tempa\@firstoftwo
2068   \else
2069   \fi}%
```

Finally we execute `\bbl@tempa`.

```
2070   \bbl@tempa
2071 }
```

`\bbl@clear@ttribs` This macro removes all the attribute code from \TeX 's memory at `\begin{document}` time (if any is present).

```

2072 \def\bbl@clear@ttribs{%
2073   \ifx\bbl@attributes\@undefined\else
2074     \bbl@loopx\bbl@tempa{\bbl@attributes}{%
2075       \expandafter\bbl@clear@ttrib\bbl@tempa.
2076     }%
2077     \let\bbl@attributes\@undefined
2078   \fi}
2079 \def\bbl@clear@ttrib#1-#2.{%
2080   \expandafter\let\csname#1@attr@#2\endcsname\@undefined}
2081 \AtBeginDocument{\bbl@clear@ttribs}

```

9.7 Support for saving macro definitions

To save the meaning of control sequences using `\babel@save`, we use temporary control sequences. To save hash table entries for these control sequences, we don't use the name of the control sequence to be saved to construct the temporary name. Instead we simply use the value of a counter, which is reset to zero each time we begin to save new values. This works well because we release the saved meanings before we begin to save a new set of control sequence meanings (see `\selectlanguage` and `\originalTeX`). Note undefined macros are not undefined any more when saved – they are `\relax`'ed.

`\babel@savecnt` The initialization of a new save cycle: reset the counter to zero.

`\babel@beginsave`

```

2082 \bbl@trace{Macros for saving definitions}
2083 \def\babel@beginsave{\babel@savecnt\z@}

```

Before it's forgotten, allocate the counter and initialize all.

```

2084 \newcount\babel@savecnt
2085 \babel@beginsave

```

`\babel@save` The macro `\babel@save{csname}` saves the current meaning of the control sequence `<csname>` to `\originalTeX`³¹. To do this, we let the current meaning to a temporary control sequence, the restore commands are appended to `\originalTeX` and the counter is incremented. The macro `\babel@savevariable{variable}` saves the value of the variable. `<variable>` can be anything allowed after the `\the` primitive.

```

2086 \def\babel@save#1{%
2087   \expandafter\let\csname babel@number\babel@savecnt\endcsname#1\relax
2088   \toks@\expandafter{\originalTeX\let#1=}
2089   \bbl@exp{%
2090     \def\\originalTeX{\the\toks@<\babel@number\babel@savecnt>\relax}}
2091   \advance\babel@savecnt@ne}
2092 \def\babel@savevariable#1{%
2093   \toks@\expandafter{\originalTeX #1=}
2094   \bbl@exp{\def\\originalTeX{\the\toks@the#1\relax}}}

```

`\bbl@frenchspacing` Some languages need to have `\frenchspacing` in effect. Others don't want that. The command `\bbl@frenchspacing` switches it on when it isn't already in effect and `\bbl@nonfrenchspacing` switches it off if necessary.

```

2095 \def\bbl@frenchspacing{%

2101 \fi}
2102 \let\bbl@nonfrenchspacing\nonfrenchspacing

```

9.8 Short tags

`\babeltags` This macro is straightforward. After zapping spaces, we loop over the list and define the macros `\text<tag>` and `\<tag>`. Definitions are first expanded so that they don't contain `\csname` but the actual macro.

```

2103 \bbl@trace{Short tags}
2104 \def\babeltags#1{%
2105   \edef\bbl@tempa{\zap@space#1 \@empty}%
2106   \def\bbl@tempb##1=##2\@{}%
2107   \edef\bbl@tempc{%
2108     \noexpand\newcommand
2109     \expandafter\noexpand\csname ##1\endcsname{%
2110       \noexpand\protect
2111       \expandafter\noexpand\csname otherlanguage*\endcsname{##2}}
2112     \noexpand\newcommand
2113     \expandafter\noexpand\csname text##1\endcsname{%
2114       \noexpand\foreignlanguage{##2}}
2115     \bbl@tempc}%
2116   \bbl@for\bbl@tempa\bbl@tempa{%
2117     \expandafter\bbl@tempb\bbl@tempa\@{}}

```

9.9 Hyphens

`\babelhyphenation` This macro saves hyphenation exceptions. Two macros are used to store them: `\bbl@hyphenation@` for the global ones and `\bbl@hyphenation<lang>` for language ones. See `\bbl@patterns` above for further details. We make sure there is a space between words when multiple commands are used.

```

2118 \bbl@trace{Hyphens}
2119 \@onlypreamble\babelhyphenation
2120 \AtEndOfPackage{%
2121   \newcommand\babelhyphenation[2][\@empty]{%
2122     \ifx\bbl@hyphenation@relax
2123       \let\bbl@hyphenation@\@empty
2124     \fi
2125     \ifx\bbl@hyphlist\@empty\else
2126       \bbl@warning{%
2127         You must not intermingle \string\selectlanguage\space and\%
2128         \string\babelhyphenation\space or some exceptions will not\%
2129         be taken into account. Reported}%
2130     \fi
2131     \ifx\@empty#1%
2132       \protected@edef\bbl@hyphenation@{\bbl@hyphenation@\space#2}%
2133     \else
2134       \bbl@vforeach{#1}{%
2135         \def\bbl@tempa{##1}%
2136         \bbl@fixname\bbl@tempa
2137         \bbl@iflanguage\bbl@tempa{%
2138           \bbl@csarg\protected@edef{hyphenation@\bbl@tempa}{%
2139             \bbl@ifunset{bbl@hyphenation@\bbl@tempa}%
2140             \@empty
2141             {\csname bbl@hyphenation@\bbl@tempa\endcsname\space}%
2142             #2}}}%
2143       \fi}}

```

`\bbl@allowhyphens` This macro makes hyphenation possible. Basically its definition is nothing more than `\nobreak \hskip 0pt plus 0pt`³².

```
2144 \def\bbl@allowhyphens{\ifvmode\else\nobreak\hskip\z@skip\fi}
2145 \def\bbl@t@one{T1}
2146 \def\allowhyphens{\ifx\cf@encoding\bbl@t@one\else\bbl@allowhyphens\fi}
```

`\babelhyphen` Macros to insert common hyphens. Note the space before @ in `\babelhyphen`. Instead of protecting it with `\DeclareRobustCommand`, which could insert a `\relax`, we use the same procedure as shorthands, with `\active@prefix`.

```
2147 \newcommand\babellnullhyphen{\char\hyphenchar\font}
2148 \def\babelhyphen{\active@prefix\babelhyphen\bbl@hyphen}
2149 \def\bbl@hyphen{%
2150   \ifstar{\bbl@hyphen@i @}{\bbl@hyphen@i \@empty}}
2151 \def\bbl@hyphen@i#1#2{%
2152   \bbl@ifunset{bbl@hy@#1#2\@empty}%
2153   {\csname bbl@#1usehyphen\endcsname{\discretionary{#2}{}{#2}}}%
2154   {\csname bbl@hy@#1#2\@empty\endcsname}}
```

The following two commands are used to wrap the “hyphen” and set the behavior of the rest of the word – the version with a single @ is used when further hyphenation is allowed, while that with @@ if no more hyphens are allowed. In both cases, if the hyphen is preceded by a positive space, breaking after the hyphen is disallowed.

There should not be a discretionary after a hyphen at the beginning of a word, so it is prevented if preceded by a skip. Unfortunately, this does handle cases like “(-suffix)”.

`\nobreak` is always preceded by `\leavevmode`, in case the shorthand starts a paragraph.

```
2155 \def\bbl@usehyphen#1{%
2156   \leavevmode
2157   \ifdim\lastskip>\z@\mbox{#1}\else\nobreak#1\fi
2158   \nobreak\hskip\z@skip}
2159 \def\bbl@usehyphen#1{%
2160   \leavevmode\ifdim\lastskip>\z@\mbox{#1}\else#1\fi}
```

The following macro inserts the hyphen char.

```
2161 \def\bbl@hyphenchar{%
2162   \ifnum\hyphenchar\font=\m@ne
2163     \babellnullhyphen
2164   \else
2165     \char\hyphenchar\font
2166   \fi}
```

Finally, we define the hyphen “types”. Their names will not change, so you may use them in ldf’s. After a space, the `\mbox` in `\bbl@hy@nobreak` is redundant.

```
2167 \def\bbl@hy@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}{}}}
2168 \def\bbl@hy@@soft{\bbl@usehyphen{\discretionary{\bbl@hyphenchar}{}{}}}
2169 \def\bbl@hy@hard{\bbl@usehyphen\bbl@hyphenchar}
2170 \def\bbl@hy@@hard{\bbl@usehyphen\bbl@hyphenchar}
2171 \def\bbl@hy@nobreak{\bbl@usehyphen{\mbox{\bbl@hyphenchar}}}
2172 \def\bbl@hy@@nobreak{\mbox{\bbl@hyphenchar}}
2173 \def\bbl@hy@repeat{%
2174   \bbl@usehyphen{%
2175     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}
2176 \def\bbl@hy@@repeat{%
2177   \bbl@usehyphen{%
2178     \discretionary{\bbl@hyphenchar}{\bbl@hyphenchar}{\bbl@hyphenchar}}}
2179 \def\bbl@hy@empty{\hskip\z@skip}
2180 \def\bbl@hy@@empty{\discretionary{}{}{}}
```

³² \TeX begins and ends a word for hyphenation at a glue node. The penalty prevents a linebreak at this glue node.

`\bbl@disc` For some languages the macro `\bbl@disc` is used to ease the insertion of discretionary for letters that behave ‘abnormally’ at a breakpoint.

```
2181 \def\bbl@disc#1#2{\nobreak\discretionary{#2-}{#1}\bbl@allowhyphens}
```

9.10 Multiencoding strings

The aim following commands is to provide a common interface for strings in several encodings. They also contains several hooks which can be used by `luatex` and `xetex`. The code is organized here with pseudo-guards, so we start with the basic commands.

Tools But first, a couple of tools. The first one makes global a local variable. This is not the best solution, but it works.

```
2182 \bbl@trace{Multiencoding strings}
2183 \def\bbl@tglobal#1{\global\let#1#1}
2184 \def\bbl@reecatcode#1{%
2185   \@tempcnta="7F
2186   \def\bbl@tempa{%
2187     \ifnum\@tempcnta>"FF\else
2188       \catcode\@tempcnta=#1\relax
2189       \advance\@tempcnta\@ne
2190       \expandafter\bbl@tempa
2191     \fi}%
2192   \bbl@tempa}
```

The second one. We need to patch `\@uclclist`, but it is done once and only if `\SetCase` is used or if strings are encoded. The code is far from satisfactory for several reasons, including the fact `\@uclclist` is not a list any more. Therefore a package option is added to ignore it. Instead of gobbling the macro getting the next two elements (usually `\reserved@a`), we pass it as argument to `\bbl@uclc`. The parser is restarted inside `\<lang>\bbl@uclc` because we do not know how many expansions are necessary (depends on whether strings are encoded). The last part is tricky – when uppercasing, we have:

```
\let\bbl@tolower\@empty\bbl@toupper\@empty
```

and starts over (and similarly when lowercasing).

```
2193 \@ifpackagewith{babel}{nocase}%
2194 {\let\bbl@patchuclc\relax}%
2195 {\def\bbl@patchuclc{%
2196   \global\let\bbl@patchuclc\relax
2197   \g@addto@macro\@uclclist{\reserved@b{\reserved@b\bbl@uclc}}%
2198   \gdef\bbl@uclc##1{%
2199     \let\bbl@encoded\bbl@encoded@uclc
2200     \bbl@ifunset{\language @bbl@uclc}% and resumes it
2201     {##1}%
2202     {\let\bbl@tempa##1\relax % Used by LANG@bbl@uclc

2248 \let\bbl@startcmds\StartBabelCommands

```

Parse the encoding info to get the label, input, and font parts.

Select the behavior of \SetString. There are two main cases, depending of if there is an optional argument: without it and strings=encoded, strings are defined always; otherwise, they are set only if they are still undefined (ie, fallback values). With labelled blocks and strings=encoded, define the strings, but with another value, define strings only if the current label or font encoding is the value of strings; otherwise (ie, no strings or a block whose label is not in strings=) do nothing.

We presume the current block is not loaded, and therefore set (above) a couple of default values to gobble the arguments. Then, these macros are redefined if necessary according to several parameters.

```

```

There are two versions of `\bbbl@scswitch`. The first version is used when `ldfs` are read, and it makes sure `\langle group \rangle \langle language \rangle` is reset, but only once (`\bbbl@screset` is used to keep track of this). The second version is used in the preamble and packages loaded after babel

and does nothing. The macro `\bbl@forlang` loops `\bbl@L` but its body is executed only if the value is in `\BabelLanguages` (inside `babel`) or `\date<language>` is defined (after `babel` has been loaded). There are also two version of `\bbl@forlang`. The first one skips the current iteration if the language is not in `\BabelLanguages` (used in `ldfs`), and the second one skips undefined languages (after `babel` has been loaded) .

```

2308 \def\bbl@forlang#1#2{%
2309   \bbl@for#1\bbl@L{%
2310     \bbl@xin@{,#1,},{,\BabelLanguages,}%
2311     \ifin@#2\relax\fi}}
2312 \def\bbl@scswitch{%

2323     \fi}}
2324 \AtEndOfPackage{%
2325   \def\bbl@forlang#1#2{\bbl@for#1\bbl@L{\bbl@ifunset{date#1}{\#2}}}%
2326   \let\bbl@scswitch\relax}
2327 \@onlypreamble\EndBabelCommands
2328 \def\EndBabelCommands{%
2329   \bbl@usehooks{stopcommands}{}%
2330   \endgroup
2331   \endgroup
2332   \bbl@scafter}
2333 \let\bbl@endcommands\EndBabelCommands

```

Now we define commands to be used inside `\StartBabelCommands`.

Strings The following macro is the actual definition of `\SetString` when it is “active” First save the “switcher”. Create it if undefined. Strings are defined only if undefined (ie, like `\providescommand`). With the event `stringprocess` you can preprocess the string by manipulating the value of `\BabelString`. If there are several hooks assigned to this event, preprocessing is done in the same order as defined. Finally, the string is set.

```

2334 \def\bbl@setstring#1#2{%
2335   \bbl@forlang\bbl@tempa{%
2336     \edef\bbl@LC{\bbl@tempa\bbl@stripslash#1}%
2337     \bbl@ifunset{\bbl@LC}% eg, \germanchaptername
2338     {\global\expandafter % TODO - con \bbl@exp ?
2339      \bbl@add\csname\bbl@G\bbl@tempa\expandafter\endcsname\expandafter
2340      {\expandafter\bbl@scset\expandafter#1\csname\bbl@LC\endcsname}}}%
2341     {}}%
2342   \def\BabelString{#2}%
2343   \bbl@usehooks{stringprocess}{}%
2344   \expandafter\bbl@stringdef
2345   \csname\bbl@LC\expandafter\endcsname\expandafter{\BabelString}}

```

Now, some additional stuff to be used when encoded strings are used. Captions then include `\bbl@encoded` for string to be expanded in case transformations. It is `\relax` by default, but in `\MakeUppercase` and `\MakeLowercase` its value is a modified expandable `\@changed@cmd`.

```

2346 \ifx\bbl@opt@strings\relax

```

```

2347 \def\bbl@scset#1#2{\def#1{\bbl@encoded#2}}
2348 \bbl@patchuclc
2349 \let\bbl@encoded\relax
2350 \def\bbl@encoded@uclc#1{%
2351   \@inmathwarn#1%
2352   \expandafter\ifx\csname\cf@encoding\string#1\endcsname\relax
2353     \expandafter\ifx\csname ?\string#1\endcsname\relax
2354       \TextSymbolUnavailable#1%
2355     \else
2356       \csname ?\string#1\endcsname
2357     \fi
2358   \else
2359     \csname\cf@encoding\string#1\endcsname
2360   \fi}
2361 \else
2362   \def\bbl@scset#1#2{\def#1{#2}}
2363 \fi

```

Define `\SetStringLoop`, which is actually set inside `\StartBabelCommands`. The current definition is somewhat complicated because we need a count, but `\count@` is not under our control (remember `\SetString` may call hooks). Instead of defining a dedicated count, we just “pre-expand” its value.

```

2364 <<*Macros local to BabelCommands>> ≡
2365 \def\SetStringLoop##1##2{%
2366   \def\bbl@templ####1{\expandafter\noexpand\csname##1\endcsname}%
2367   \count@\z@
2368   \bbl@loop\bbl@tempa{##2}{% empty items and spaces are ok
2369     \advance\count@\@ne
2370     \toks@\expandafter{\bbl@tempa}%
2371     \bbl@exp{%
2372       \\SetString\bbl@templ{\romannumeral\count@}{\the\toks@}%
2373       \count@=\the\count@\relax}}}%
2374 <</Macros local to BabelCommands>>

```

Delaying code Now the definition of `\AfterBabelCommands` when it is activated.

```

2375 \def\bbl@aftercmds#1{%
2376   \toks@\expandafter{\bbl@scafter#1}%
2377   \xdef\bbl@scafter{\the\toks@}}

```

Case mapping The command `\SetCase` provides a way to change the behavior of `\MakeUppercase` and `\MakeLowercase`. `\bbl@tempa` is set by the patched `\@uclclist` to the parsing command.

```

2378 <<*Macros local to BabelCommands>> ≡
2379 \newcommand\SetCase[3][{}{%
2380   \bbl@patchuclc
2381   \bbl@forlang\bbl@tempa{%
2382     \expandafter\bbl@encstring
2383     \csname\bbl@tempa @bbl@uclc\endcsname{\bbl@tempa##1}%
2384     \expandafter\bbl@encstring
2385     \csname\bbl@tempa @bbl@uc\endcsname{##2}%
2386     \expandafter\bbl@encstring
2387     \csname\bbl@tempa @bbl@lc\endcsname{##3}}}%
2388 <</Macros local to BabelCommands>>

```

Macros to deal with case mapping for hyphenation. To decide if the document is monolingual or multilingual, we make a rough guess – just see if there is a comma in the languages list, built in the first pass of the package options.

```

2389 <<*Macros local to BabelCommands>> ≡
2390 \newcommand\SetHyphenMap[1]{%
2391   \bbl@forlang\bbl@tempa{%
2392     \expandafter\bbl@stringdef
2393     \csname\bbl@tempa @bbl@hyphenmap\endcsname{##1}}}%
2394 <</Macros local to BabelCommands>>

```

There are 3 helper macros which do most of the work for you.

```

9.11 Macros common to a number of languages

`\set@low@box` The following macro is used to lower quotes to the same level as the comma. It prepares its argument in box register 0.

```

2432 \bbl@trace{Macros related to glyphs}
2433 \def\set@low@box#1{\setbox\tw@ \hbox{,}\setbox\z@ \hbox{#1}%
2434   \dimen\z@ \ht\z@ \advance\dimen\z@ -\ht\tw@%
2435   \setbox\z@ \hbox{\lower\dimen\z@ \box\z@}\ht\z@ \ht\tw@ \dp\z@ \dp\tw@}

```

`\save@sf@q` The macro `\save@sf@q` is used to save and reset the current space factor.

```
2436 \def\save@sf@q#1{\leavevmode
2437   \begingroup
2438     \edef\@SF{\spacefactor\the\spacefactor}#1\@SF
2439   \endgroup}
```

9.12 Making glyphs available

This section makes a number of glyphs available that either do not exist in the OT1 encoding and have to be ‘faked’, or that are not accessible through `T1enc.def`.

9.12.1 Quotation marks

`\quotedblbase` In the T1 encoding the opening double quote at the baseline is available as a separate character, accessible via `\quotedblbase`. In the OT1 encoding it is not available, therefore we make it available by lowering the normal open quote character to the baseline.

```
2440 \ProvideTextCommand{\quotedblbase}{OT1}{%
2441   \save@sf@q{\set@low@box{\textquotedblright\}%
2442     \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2443 \ProvideTextCommandDefault{\quotedblbase}{%
2444   \UseTextSymbol{OT1}{\quotedblbase}}
```

`\quotesinglbase` We also need the single quote character at the baseline.

```
2445 \ProvideTextCommand{\quotesinglbase}{OT1}{%
2446   \save@sf@q{\set@low@box{\textquoteright\}%
2447     \box\z@\kern-.04em\bbl@allowhyphens}}
```

Make sure that when an encoding other than OT1 or T1 is used this glyph can still be typeset.

```
2448 \ProvideTextCommandDefault{\quotesinglbase}{%
2449   \UseTextSymbol{OT1}{\quotesinglbase}}
```

`\guillemotleft` The guillemet characters are not available in OT1 encoding. They are faked.

```
\guillemotright 2450 \ProvideTextCommand{\guillemotleft}{OT1}{%
2451   \ifmmode
2452     \ll
2453   \else
2454     \save@sf@q{\nobreak
2455       \raise.2ex\hbox{$\scriptscriptstyle\ll$}\bbl@allowhyphens}%
2456   \fi}
2457 \ProvideTextCommand{\guillemotright}{OT1}{%
2458   \ifmmode
2459     \gg
2460   \else
2461     \save@sf@q{\nobreak
2462       \raise.2ex\hbox{$\scriptscriptstyle\gg$}\bbl@allowhyphens}%
2463   \fi}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2464 \ProvideTextCommandDefault{\guillemotleft}{%
2465   \UseTextSymbol{OT1}{\guillemotleft}}
2466 \ProvideTextCommandDefault{\guillemotright}{%
2467   \UseTextSymbol{OT1}{\guillemotright}}
```

`\guilsinglleft` The single guillemets are not available in OT1 encoding. They are faked.
`\guilsinglright`

```
2468 \ProvideTextCommand{\guilsinglleft}{OT1}{%
2469   \ifmmode
2470     <%
2471   \else
2472     \save@sf@q{\nobreak
2473       \raise.2ex\hbox{$\scriptscriptstyle<$}\bbl@allowhyphens}%
2474   \fi}
2475 \ProvideTextCommand{\guilsinglright}{OT1}{%
2476   \ifmmode
2477     >%
2478   \else
2479     \save@sf@q{\nobreak
2480       \raise.2ex\hbox{$\scriptscriptstyle>$}\bbl@allowhyphens}%
2481   \fi}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2482 \ProvideTextCommandDefault{\guilsinglleft}{%
2483   \UseTextSymbol{OT1}{\guilsinglleft}}
2484 \ProvideTextCommandDefault{\guilsinglright}{%
2485   \UseTextSymbol{OT1}{\guilsinglright}}
```

9.12.2 Letters

`\ij` The dutch language uses the letter ‘ij’. It is available in T1 encoded fonts, but not in the OT1
`\IJ` encoded fonts. Therefore we fake it for the OT1 encoding.

```
2486 \DeclareTextCommand{\ij}{OT1}{%
2487   i\kern-0.02em\bbl@allowhyphens j}
2488 \DeclareTextCommand{\IJ}{OT1}{%
2489   I\kern-0.02em\bbl@allowhyphens J}
2490 \DeclareTextCommand{\ij}{T1}{\char188}
2491 \DeclareTextCommand{\IJ}{T1}{\char156}
```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```
2492 \ProvideTextCommandDefault{\ij}{%
2493   \UseTextSymbol{OT1}{\ij}}
2494 \ProvideTextCommandDefault{\IJ}{%
2495   \UseTextSymbol{OT1}{\IJ}}
```

`\dj` The croatian language needs the letters `\dj` and `\DJ`; they are available in the T1 encoding,
`\DJ` but not in the OT1 encoding by default.

Some code to construct these glyphs for the OT1 encoding was made available to me by Stipčević Mario, (stipcevic@olimp.irb.hr).

```
2496 \def\crrtic@{\hrule height0.1ex width0.3em}
2497 \def\crrtic@{\hrule height0.1ex width0.33em}
2498 \def\ddj@{%
2499   \setbox0\hbox{d}\dimen@=\ht0
2500   \advance\dimen@1ex
2501   \dimen@.45\dimen@
2502   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
2503   \advance\dimen@ii.5ex
2504   \leavevmode\rlap{\raise\dimen@\hbox{\kern\dimen@ii\vbox{\crrtic@}}}}
2505 \def\DDJ@{%
2506   \setbox0\hbox{D}\dimen@=.55\ht0
2507   \dimen@ii\expandafter\rem@pt\the\fontdimen\@ne\font\dimen@
```

```

2508 \advance\dimen@ii.15ex % correction for the dash position
2509 \advance\dimen@ii-.15\fontdimen7\font % correction for cmtt font
2510 \dimen\thr@@\expandafter\rem\pt\the\fontdimen7\font\dimen@
2511 \leavevmode\rlap{\raise\dimen@hbox{\kern\dimen@ii\vbox{\crttic@}}}}
2512 %
2513 \DeclareTextCommand{\dj}{OT1}{\ddj@ d}
2514 \DeclareTextCommand{\DJ}{OT1}{\DDJ@ D}

```

Make sure that when an encoding other than OT1 or T1 is used these glyphs can still be typeset.

```

2515 \ProvideTextCommandDefault{\dj}{%
2516 \UseTextSymbol{OT1}{\dj}}
2517 \ProvideTextCommandDefault{\DJ}{%
2518 \UseTextSymbol{OT1}{\DJ}}

```

\SS For the T1 encoding \SS is defined and selects a specific glyph from the font, but for other encodings it is not available. Therefore we make it available here.

```

2519 \DeclareTextCommand{\SS}{OT1}{SS}
2520 \ProvideTextCommandDefault{\SS}{\UseTextSymbol{OT1}{\SS}}

```

9.12.3 Shorthands for quotation marks

Shorthands are provided for a number of different quotation marks, which make them usable both outside and inside mathmode. They are defined with \ProvideTextCommandDefault, but this is very likely not required because their definitions are based on encoding-dependent macros.

\glq The ‘german’ single quotes.

```

\grq 2521 \ProvideTextCommandDefault{\glq}{%
2522 \textormath{\quotesinglbase}{\mbox{\quotesinglbase}}}

```

The definition of \grq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2523 \ProvideTextCommand{\grq}{T1}{%
2524 \textormath{\kern\z@\textquoteleft}{\mbox{\textquoteleft}}}
2525 \ProvideTextCommand{\grq}{TU}{%
2526 \textormath{\textquoteleft}{\mbox{\textquoteleft}}}
2527 \ProvideTextCommand{\grq}{OT1}{%
2528 \save@sf@q{\kern-.0125em
2529 \textormath{\textquoteleft}{\mbox{\textquoteleft}}}%
2530 \kern.07em\relax}}
2531 \ProvideTextCommandDefault{\grq}{\UseTextSymbol{OT1}\grq}

```

\glqq The ‘german’ double quotes.

```

\grqq 2532 \ProvideTextCommandDefault{\glqq}{%
2533 \textormath{\quotedblbase}{\mbox{\quotedblbase}}}

```

The definition of \grqq depends on the fontencoding. With T1 encoding no extra kerning is needed.

```

2534 \ProvideTextCommand{\grqq}{T1}{%
2535 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2536 \ProvideTextCommand{\grqq}{TU}{%
2537 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}
2538 \ProvideTextCommand{\grqq}{OT1}{%
2539 \save@sf@q{\kern-.07em
2540 \textormath{\textquotedblleft}{\mbox{\textquotedblleft}}}%
2541 \kern.07em\relax}}
2542 \ProvideTextCommandDefault{\grqq}{\UseTextSymbol{OT1}\grqq}

```

`\flq` The ‘french’ single guillemets.

```

\frq 2543 \ProvideTextCommandDefault{\flq}{%
      2544 \textormath{\guilsinglleft}{\mbox{\guilsinglleft}}}
      2545 \ProvideTextCommandDefault{\frq}{%
      2546 \textormath{\guilsinglright}{\mbox{\guilsinglright}}}

```

`\flqq` The ‘french’ double guillemets.

```

\frqq 2547 \ProvideTextCommandDefault{\flqq}{%
      2548 \textormath{\guillemotleft}{\mbox{\guillemotleft}}}
      2549 \ProvideTextCommandDefault{\frqq}{%
      2550 \textormath{\guillemotright}{\mbox{\guillemotright}}}

```

9.12.4 Umlauts and tremas

The command `\` needs to have a different effect for different languages. For German for instance, the ‘umlaut’ should be positioned lower than the default position for placing it over the letters a, o, u, A, O and U. When placed over an e, i, E or I it can retain its normal position. For Dutch the same glyph is always placed in the lower position.

`\umlauthigh` To be able to provide both positions of `\` we provide two commands to switch the positioning, the default will be `\umlauthigh` (the normal positioning).

```

2551 \def\umlauthigh{%
2552   \def\bbl@umlauta##1{\leavevmode\bgroup%
2553     \expandafter\accent\csname\fontencoding dqpos\endcsname
2554       ##1\bbl@allowhyphens\egroup}%
2555   \let\bbl@umlaute\bbl@umlauta}
2556 \def\umlautlow{%
2557   \def\bbl@umlauta{\protect\lower@umlaut}}
2558 \def\umlautelow{%
2559   \def\bbl@umlaute{\protect\lower@umlaut}}
2560 \umlauthigh

```

`\lower@umlaut` The command `\lower@umlaut` is used to position the `\` closer to the letter. We want the umlaut character lowered, nearer to the letter. To do this we need an extra *⟨dimen⟩* register.

```

2561 \expandafter\ifx\csname U@D\endcsname\relax
2562   \csname newdimen\endcsname\U@D
2563 \fi

```

The following code fools T_EX’s `make_accent` procedure about the current x-height of the font to force another placement of the umlaut character. First we have to save the current x-height of the font, because we’ll change this font dimension and this is always done globally.

Then we compute the new x-height in such a way that the umlaut character is lowered to the base character. The value of `.45ex` depends on the METAFONT parameters with which the fonts were built. (Just try out, which value will look best.) If the new x-height is too low, it is not changed. Finally we call the `\accent` primitive, reset the old x-height and insert the base character in the argument.

```

2564 \def\lower@umlaut#1{%
2565   \leavevmode\bgroup
2566     \U@D 1ex%
2567     {\setbox\z@\hbox{%
2568       \expandafter\char\csname\fontencoding dqpos\endcsname}%
2569       \dimen@ -.45ex\advance\dimen@\ht\z@
2570       \ifdim 1ex<\dimen@ \fontdimen5\font\dimen@ \fi}%
2571   \expandafter\accent\csname\fontencoding dqpos\endcsname

```

```

2572 \fontdimen5\font\U@D #1%
2573 \egroup}

```

For all vowels we declare `\` to be a composite command which uses `\bbl@umlauta` or `\bbl@umlaute` to position the umlaut character. We need to be sure that these definitions override the ones that are provided when the package `fontenc` with option `OT1` is used. Therefore these declarations are postponed until the beginning of the document. Note these definitions only apply to some languages, but `babel` sets them for *all* languages – you may want to redefine `\bbl@umlauta` and/or `\bbl@umlaute` for a language in the corresponding `ldf` (using the `babel` switching mechanism, of course).

```

2574 \AtBeginDocument{%
2575 \DeclareTextCompositeCommand{\}{OT1}{a}{\bbl@umlauta{a}}%
2576 \DeclareTextCompositeCommand{\}{OT1}{e}{\bbl@umlaute{e}}%
2577 \DeclareTextCompositeCommand{\}{OT1}{i}{\bbl@umlaute{i}}%
2578 \DeclareTextCompositeCommand{\}{OT1}{\i}{\bbl@umlaute{i}}%
2579 \DeclareTextCompositeCommand{\}{OT1}{o}{\bbl@umlauta{o}}%
2580 \DeclareTextCompositeCommand{\}{OT1}{u}{\bbl@umlauta{u}}%
2581 \DeclareTextCompositeCommand{\}{OT1}{A}{\bbl@umlauta{A}}%
2582 \DeclareTextCompositeCommand{\}{OT1}{E}{\bbl@umlaute{E}}%
2583 \DeclareTextCompositeCommand{\}{OT1}{I}{\bbl@umlaute{I}}%
2584 \DeclareTextCompositeCommand{\}{OT1}{O}{\bbl@umlauta{O}}%
2585 \DeclareTextCompositeCommand{\}{OT1}{U}{\bbl@umlauta{U}}%
2586 }

```

Finally, make sure the default hyphenrules are defined (even if empty).

```

2587 \ifx\l@english\@undefined
2588 \chardef\l@english\z@
2589 \fi

```

9.13 Layout

Work in progress.

Layout is mainly intended to set bidi documents, but there is at least a tool useful in general.

The code for additive counters is somewhat tricky and it's based on the fact the arguments just before @@ collect digits which have been left 'unused' in previous arguments, the

first of them being the number of digits in the number to be converted. This explains the reverse set 76543210. Digits above 10000 are not handled yet. When the key contains the subkey .F., the number after is treated as an special case. for a fixed form (see babel-he.ini, for example).

11 Loading hyphenation patterns

The following code is meant to be read by \LaTeX because it should instruct \TeX to read hyphenation patterns. To this end the `docstrip` option `patterns` can be used to include this code in the file `hyphen.cfg`. Code is written with lower level macros.

We want to add a message to the message \LaTeX 2.09 puts in the `\everyjob` register. This could be done by the following code:

```

\let\orgeveryjob\everyjob
\def\everyjob#1{%
  \orgeveryjob{#1}%
  \orgeveryjob\expandafter{\the\orgeveryjob\immediate\write16{%
    hyphenation patterns for \the\loaded@patterns loaded.}}%
\let\everyjob\orgeveryjob\let\orgeveryjob\@undefined}

```

The code above redefines the control sequence `\everyjob` in order to be able to add something to the current contents of the register. This is necessary because the processing of hyphenation patterns happens long before \LaTeX fills the register. There are some problems with this approach though.

- When someone wants to use several hyphenation patterns with \LaTeX the above scheme won't work. The reason is that \LaTeX overwrites the contents of the `\everyjob` register with its own message.
- Plain \TeX does not use the `\everyjob` register so the message would not be displayed.

To circumvent this a 'dirty trick' can be used. As this code is only processed when creating a new format file there is one command that is sure to be used, `\dump`. Therefore the original `\dump` is saved in `\orig@dump` and a new definition is supplied. To make sure that \LaTeX 2.09 executes the `\@begindocumenthook` we would want to alter `\begin{document}`, but as this done too often already, we add the new code at the front of `\@preamblecmds`. But we can only do that after it has been defined, so we add this piece of code to `\dump`.

This new definition starts by adding an instruction to write a message on the terminal and in the transcript file to inform the user of the preloaded hyphenation patterns. Then everything is restored to the old situation and the format is dumped.

```

3480 <<Define core switching macros>>

```

`\process@line` Each line in the file language.dat is processed by `\process@line` after it is read. The first thing this macro does is to check whether the line starts with `=`. When the first token of a line is an `=`, the macro `\process@synonym` is called; otherwise the macro `\process@language` will continue.

```

3481 \def\process@line#1#2 #3 #4 {%
3482   \ifx=#1%
3483     \process@synonym{#2}%
3484   \else
3485     \process@language{#1#2}{#3}{#4}%

```

```

3486 \fi
3487 \ignorespaces}

```

`\process@synonym` This macro takes care of the lines which start with an =. It needs an empty token register to begin with. `\bbl@languages` is also set to empty.

```

3488 \toks@{}
3489 \def\bbl@languages{}

```

When no languages have been loaded yet, the name following the = will be a synonym for hyphenation register 0. So, it is stored in a token register and executed when the first pattern file has been processed. (The `\relax` just helps to the `\if` below catching synonyms without a language.)

Otherwise the name will be a synonym for the language loaded last.

We also need to copy the hyphenmin parameters for the synonym.

```

3490 \def\process@synonym#1{%
3491   \ifnum\last@language=\m@ne
3492     \toks@\expandafter{\the\toks@\relax\process@synonym{#1}}%
3493   \else
3494     \expandafter\chardef\csname l@#1\endcsname\last@language
3495     \wlog{\string\l@#1=\string\language\the\last@language}%
3496     \expandafter\let\csname #1hyphenmins\expandafter\endcsname
3497       \csname\language\hyphenmins\endcsname
3498     \let\bbl@elt\relax
3499     \edef\bbl@languages{\bbl@languages\bbl@elt{#1}{\the\last@language}}}%
3500   \fi}

```

`\process@language` The macro `\process@language` is used to process a non-empty line from the ‘configuration file’. It has three arguments, each delimited by white space. The first argument is the ‘name’ of a language; the second is the name of the file that contains the patterns. The optional third argument is the name of a file containing hyphenation exceptions. The first thing to do is call `\addlanguage` to allocate a pattern register and to make that register ‘active’. Then the pattern file is read.

For some hyphenation patterns it is needed to load them with a specific font encoding selected. This can be specified in the file `language.dat` by adding for instance ‘:T1’ to the name of the language. The macro `\bbl@get@enc` extracts the font encoding from the language name and stores it in `\bbl@hyph@enc`. The latter can be used in hyphenation files if you need to set a behavior depending on the given encoding (it is set to empty if no encoding is given).

Pattern files may contain assignments to `\lefthyphenmin` and `\righthyphenmin`. T_EX does not keep track of these assignments. Therefore we try to detect such assignments and store them in the `\langhyphenmins` macro. When no assignments were made we provide a default setting.

Some pattern files contain changes to the `\lccode` and `\uccode` arrays. Such changes should remain local to the language; therefore we process the pattern file in a group; the `\patterns` command acts globally so its effect will be remembered.

Then we globally store the settings of `\lefthyphenmin` and `\righthyphenmin` and close the group.

When the hyphenation patterns have been processed we need to see if a file with hyphenation exceptions needs to be read. This is the case when the third argument is not empty and when it does not contain a space token. (Note however there is no need to save hyphenation exceptions into the format.)

`\bbl@languages` saves a snapshot of the loaded languages in the form

`\bbl@elt{<language-name>}{<number>}{<patterns-file>}{<exceptions-file>}`. Note the last 2 arguments are empty in ‘dialects’ defined in `language.dat` with =. Note also the language name can have encoding info.

Finally, if the counter `\language` is equal to zero we execute the synonyms stored.

```

Pattern registers are allocated using count register `\last@language`. Its initial value is 0. The definition of the macro `\newlanguage` is such that it first increments the count register and then defines the language. In order to have the first patterns loaded in pattern register number 0 we initialize `\last@language` with the value -1 .

```

3609 \last@language\m@ne

```

We now read lines from the file until the end is found

```

3610 \loop

```

While reading from the input, it is useful to switch off recognition of the end-of-line character. This saves us stripping off spaces from the contents of the control sequence.

```

3611 \endlinechar\m@ne
3612 \read1 to \bbl@line
3613 \endlinechar`\^^M

```

If the file has reached its end, exit from the loop here. If not, empty lines are skipped. Add 3 space characters to the end of `\bbl@line`. This is needed to be able to recognize the arguments of `\process@line` later on. The default language should be the very first one.

```

13.2 Layout

In progress.

Note elements like headlines and margins can be modified easily with packages like fancyhdr, typearea or titles, and geometry.

\bbl@startskip and \bbl@endskip are available to package authors. Thanks to the T_EX expansion mechanism the following constructs are valid: \adim\bbl@startskip, \advance\bbl@startskip\adim, \bbl@startskip\adim.

Consider txtbabel as a shorthand for *tex-xet babel*, which is the bidi model in both pdfTeX and xetex.

13.3 LuaTeX

The loader for luatex is based solely on language.dat, which is read on the fly. The code shouldn't be executed when the format is build, so we check if \AddBabelHook is defined. Then comes a modified version of the loader in hyphen.cfg (without the hyphenmins stuff, which is under the direct control of babel).

The names \l@<language> are defined and take some value from the beginning because all ldf files assume this for the corresponding language to be considered valid, but patterns are not loaded (except the first one). This is done later, when the language is first selected (which usually means when the ldf finishes). If a language has been loaded, \bbl@hyphendata@<num> exists (with the names of the files read).

The default setup preloads the first language into the format. This is intended mainly for 'english', so that it's available without further intervention from the user. To avoid duplicating it, the following rule applies: if the "0th" language and the first language in language.dat have the same name then just ignore the latter. If there are new synonymous, the are added, but note if the language patterns have not been preloaded they won't at run time.

Other preloaded languages could be read twice, if they have been preloaded into the format. This is not optimal, but it shouldn't happen very often – with luatex patterns are best loaded when the document is typeset, and the “0th” language is preloaded just for backwards compatibility.

As of 1.1b, lua(e)tex is taken into account. Formerly, loading of patterns on the fly didn't work in this format, but with the new loader it does. Unfortunately, the format is not based on babel, and data could be duplicated, because languages are reassigned above those in the format (nothing serious, anyway). Note even with this format language.dat is used (under the principle of a single source), instead of language.def.

Of course, there is room for improvements, like tools to read and reassign languages, which would require modifying the language list, and better error handling.

We need catcode tables, but no format (targeted by babel) provide a command to allocate them (although there are packages like ctablestack). FIX - This isn't true anymore. For the moment, a dangerous approach is used - just allocate a high random number and cross the fingers. To complicate things, etex.sty changes the way languages are allocated.

This files is read at three places: (1) when plain.def, babel.sty starts, to read the list of available languages from language.dat (for the base option); (2) at hyphen.cfg, to modify some macros; (3) in the middle of plain.def and babel.sty, by babel.def, with the commands and other definitions for luatex (eg, \babelpatterns).

13.4 Southeast Asian scripts

First, some general code for line breaking, used by \babelposthyphenation.

In progress. Replace regular (ie, implicit) discretionaries by spaceskips, based on the previous glyph (which I think makes sense, because the hyphen and the previous char go always together). Other discretionaries are not touched.

For the moment, only 3 SA languages are activated by default (see Unicode UAX 14).

```

13.5 CJK line breaking

Minimal line breaking for CJK scripts, mainly intended for simple documents and short texts as a secondary language. Only line breaking, with a little stretching for justification, without any attempt to adjust the spacing. It is based on (but does not strictly follow) the Unicode algorithm.

We first need a little table with the corresponding line breaking properties. A few characters have an additional key for the width (fullwidth vs. halfwidth), not yet used. There is a separate file, defined below.

Work in progress.

Common stuff.

```

4580 \AddBabelHook{babel-fontspec}{afterextras}{\bbl@switchfont}
4581 \AddBabelHook{babel-fontspec}{beforestart}{\bbl@ckeckstdfonts}
4582 \DisableBabelHook{babel-fontspec}
4583 <<Font selection>>

```

13.6 Automatic fonts and ids switching

After defining the blocks for a number of scripts (must be extended and very likely fine tuned), we define a short function which just traverse the node list to carry out the replacements. The table `loc_to_scr` gets the locale form a script range (note the locale is the key, and that there is an intermediate table built on the fly for optimization). This locale is then used to get the `\language` and the `\localeid` as stored in `locale_props`, as well as the font (as requested). In the latter table a key starting with `/` maps the font from the global one (the key) to the local one (the value). Maths are skipped and discretionaries are handled in a special way.

```

Post-handling hyphenation patterns for non-standard rules, like ff to ff-f. There are still some issues with speed (not very slow, but still slow).

After declaring the table containing the patterns with their replacements, we define some auxiliary functions: `str_to_nodes` converts the string returned by a function to a node list, taking the node at base as a model (font, language, etc.); `fetch_word` fetches a series of glyphs and discretionaries, which pattern is matched against (if there is a match, it is called again before trying other patterns, and this is very likely the main bottleneck). `post_hyphenate_replace` is the callback applied after `lang.hyphenate`. This means the automatic hyphenation points are known. As empty captures return a byte position (as explained in the `luatex` manual), we must convert it to a utf8 position. With `first`, the last byte can be the leading byte in a utf8 sequence, so we just remove it and add 1 to the resulting length. With `last` we must take into account the capture position points to the next character. Here `word_head` points to the starting node of the text to be matched.

4938 end
4939
4940 }

```

Now the T_EX high level interface, which requires the function defined above for converting strings to functions returning a string. These functions handle the {*n*} syntax. For example, `pre={1}{1}`- becomes `function(m) return m[1]..m[1]..'-' end`, where `m`

are the matches returned after applying the pattern. With a mapped capture the functions are similar to `function(m) return Babel.capt_map(m[1],1) end`, where the last argument identifies the mapping to be applied to `m[1]`. The way it is carried out is somewhat tricky, but the effect is not dissimilar to lua `load` – save the code as string in a TeX macro, and expand this macro at the appropriate place. As `\directlua` does not take into account the current catcode of `@`, we just avoid this character in macro names (which explains the internal group, too).

```

13.7 Layout

Work in progress.

Unlike xetex, luatex requires only minimal changes for right-to-left layouts, particularly in monolingual documents (the engine itself reverses boxes – including column order or headings –, margins, etc.) with `bidi=basic`, without having to patch almost any macro where text direction is relevant.

`\@hangfrom` is useful in many contexts and it is redefined always with the layout option.

There are, however, a number of issues when the text direction is not the same as the box direction (as set by `\bodydir`), and when `\parbox` and `\hangindent` are involved.

Fortunately, latest releases of `luatex` simplify a lot the solution with `\shapemode`.

With the issue #15 I realized commands are best patched, instead of redefined. With a few lines, a modification could be applied to several classes and packages. Now, `tabular` seems to work (at least in simple cases) with `array`, `tabularx`, `hline`, `colortbl`, `longtable`, `booktabs`, etc. However, `dcolumn` still fails.

13.8 Auto bidi with basic and basic-r

The file `babel-data-bidi.lua` currently only contains data. It is a large and boring file and it is not shown here (see the generated file), but here is a sample:

```
[0x25]={d='et'},
[0x26]={d='on'},
[0x27]={d='on'},
[0x28]={d='on', m=0x29},
[0x29]={d='on', m=0x28},
[0x2A]={d='on'},
[0x2B]={d='es'},
[0x2C]={d='cs'},
```

For the meaning of these codes, see the Unicode standard.

Now the `basic-r` bidi mode. One of the aims is to implement a fast and simple bidi algorithm, with a single loop. I managed to do it for R texts, with a second smaller loop for a special case. The code is still somewhat chaotic, but its behavior is essentially correct. I cannot resist copying the following text from Emacs `bidi.c` (which also attempts to implement the bidi algorithm with a single loop):

Arrrgh!! The UAX#9 algorithm is too deeply entrenched in the assumption of batch-style processing [...]. May the fleas of a thousand camels infest the armpits of those who design supposedly general-purpose algorithms by looking at their own implementations, and fail to consider other possible implementations!

Well, it took me some time to guess what the batch rules in UAX#9 actually mean (in other word, *what* they do and *why*, and not only *how*), but I think (or I hope) I've managed to understand them.

In some sense, there are two bidi modes, one for numbers, and the other for text. Furthermore, setting just the direction in R text is not enough, because there are actually *two* R modes (set explicitly in Unicode with RLM and ALM). In `babel` the `dir` is set by a higher protocol based on the language/script, which in turn sets the correct `dir` (`<l>`, `<r>` or `<al>`).

From UAX#9: “Where available, markup should be used instead of the explicit formatting characters”. So, this simple version just ignores formatting characters. Actually, most of that annex is devoted to how to handle them.

BD14-BD16 are not implemented. Unicode (and the W3C) are making a great effort to deal with some special problematic cases in “streamed” plain text. I don't think this is the way to go – particular issues should be fixed by a high level interface taking into account the needs of the document. And here is where `luatex` excels, because everything related to bidi writing is under our control.

```

5095 (*basic-r)
5096 Babel = Babel or {}
5097
5098 Babel.bidi_enabled = true
5099
5100 require('babel-data-bidi.lua')
5101
5102 local characters = Babel.characters
5103 local ranges = Babel.ranges
5104
5105 local DIR = node.id("dir")
5106
5107 local function dir_mark(head, from, to, outer)
5108   dir = (outer == 'r') and 'TLT' or 'TRT' -- ie, reverse
5109   local d = node.new(DIR)
5110   d.dir = '+' .. dir
5111   node.insert_before(head, from, d)
5112   d = node.new(DIR)
5113   d.dir = '-' .. dir
5114   node.insert_after(head, to, d)
5115 end
5116
5117 function Babel.bidi(head, ispar)
5118   local first_n, last_n          -- first and last char with nums
5119   local last_es                  -- an auxiliary 'last' used with nums
5120   local first_d, last_d          -- first and last char in L/R block
5121   local dir, dir_real

```

Next also depends on script/lang (<al>/<r>). To be set by babel. tex.pardir is dangerous, could be (re)set but it should be changed only in vmode. There are two strong's – strong = l/al/r and strong_lr = l/r (there must be a better way):

```

5122 local strong = ('TRT' == tex.pardir) and 'r' or 'l'
5123 local strong_lr = (strong == 'l') and 'l' or 'r'
5124 local outer = strong
5125
5126 local new_dir = false
5127 local first_dir = false
5128 local inmath = false
5129
5130 local last_lr
5131
5132 local type_n = ''
5133
5134 for item in node.traverse(head) do
5135
5136   -- three cases: glyph, dir, otherwise
5137   if item.id == node.id'glyph'
5138     or (item.id == 7 and item.subtype == 2) then
5139
5140     local itemchar
5141     if item.id == 7 and item.subtype == 2 then
5142       itemchar = item.replace.char
5143     else
5144       itemchar = item.char
5145     end
5146     local chardata = characters[itemchar]
5147     dir = chardata and chardata.d or nil
5148     if not dir then
5149       for nn, et in ipairs(ranges) do

```

```

5150         if itemchar < et[1] then
5151             break
5152         elseif itemchar <= et[2] then
5153             dir = et[3]
5154             break
5155         end
5156     end
5157 end
5158 dir = dir or 'l'
5159 if inmath then dir = ('TRT' == tex.mathdir) and 'r' or 'l' end

```

Next is based on the assumption babel sets the language AND switches the script with its dir. We treat a language block as a separate Unicode sequence. The following piece of code is executed at the first glyph after a 'dir' node. We don't know the current language until then. This is not exactly true, as the math mode may insert explicit dirs in the node list, so, for the moment there is a hack by brute force (just above).

```

5160     if new_dir then
5161         attr_dir = 0
5162         for at in node.traverse(item.attr) do
5163             if at.number == luatexbase.registernumber'bbl@attr@dir' then
5164                 attr_dir = at.value % 3
5165             end
5166         end
5167         if attr_dir == 1 then
5168             strong = 'r'
5169         elseif attr_dir == 2 then
5170             strong = 'al'
5171         else
5172             strong = 'l'
5173         end
5174         strong_lr = (strong == 'l') and 'l' or 'r'
5175         outer = strong_lr
5176         new_dir = false
5177     end
5178
5179     if dir == 'nsm' then dir = strong end -- W1

```

Numbers. The dual <al>/<r> system for R is somewhat cumbersome.

```

5180     dir_real = dir -- We need dir_real to set strong below
5181     if dir == 'al' then dir = 'r' end -- W3

```

By W2, there are no <en> <et> <es> if strong == <al>, only <an>. Therefore, there are not <et en> nor <en et>, W5 can be ignored, and W6 applied:

```

5182     if strong == 'al' then
5183         if dir == 'en' then dir = 'an' end -- W2
5184         if dir == 'et' or dir == 'es' then dir = 'on' end -- W6
5185         strong_lr = 'r' -- W3
5186     end

```

Once finished the basic setup for glyphs, consider the two other cases: dir node and the rest.

```

5187     elseif item.id == node.id'dir' and not inmath then
5188         new_dir = true
5189         dir = nil
5190     elseif item.id == node.id'math' then
5191         inmath = (item.subtype == 0)
5192     else
5193         dir = nil -- Not a char
5194     end

```

Numbers in R mode. A sequence of <en>, <et>, <an>, <es> and <cs> is typeset (with some rules) in L mode. We store the starting and ending points, and only when anything different is found (including nil, ie, a non-char), the textdir is set. This means you cannot insert, say, a whatsit, but this is what I would expect (with luacolor you may colorize some digits). Anyway, this behavior could be changed with a switch in the future. Note in the first branch only <an> is relevant if <al>.

```

5195   if dir == 'en' or dir == 'an' or dir == 'et' then
5196       if dir ~= 'et' then
5197           type_n = dir
5198       end
5199       first_n = first_n or item
5200       last_n = last_es or item
5201       last_es = nil
5202   elseif dir == 'es' and last_n then -- W3+W6
5203       last_es = item
5204   elseif dir == 'cs' then             -- it's right - do nothing
5205   elseif first_n then -- & if dir = any but en, et, an, es, cs, inc nil
5206       if strong_lr == 'r' and type_n ~= '' then
5207           dir_mark(head, first_n, last_n, 'r')
5208       elseif strong_lr == 'l' and first_d and type_n == 'an' then
5209           dir_mark(head, first_n, last_n, 'r')
5210           dir_mark(head, first_d, last_d, outer)
5211           first_d, last_d = nil, nil
5212       elseif strong_lr == 'l' and type_n ~= '' then
5213           last_d = last_n
5214       end
5215       type_n = ''
5216       first_n, last_n = nil, nil
5217   end

```

R text in L, or L text in R. Order of dir_ mark's are relevant: d goes outside n, and therefore it's emitted after. See dir_mark to understand why (but is the nesting actually necessary or is a flat dir structure enough?). Only L, R (and AL) chars are taken into account – everything else, including spaces, whatsits, etc., are ignored:

```

5218   if dir == 'l' or dir == 'r' then
5219       if dir ~= outer then
5220           first_d = first_d or item
5221           last_d = item
5222       elseif first_d and dir ~= strong_lr then
5223           dir_mark(head, first_d, last_d, outer)
5224           first_d, last_d = nil, nil
5225       end
5226   end

```

Mirroring. Each chunk of text in a certain language is considered a “closed” sequence. If <r on r> and <l on l>, it's clearly <r> and <l>, resp'tly, but with other combinations depends on outer. From all these, we select only those resolving <on> → <r>. At the beginning (when last_lr is nil) of an R text, they are mirrored directly.

TODO - numbers in R mode are processed. It doesn't hurt, but should not be done.

```

5227   if dir and not last_lr and dir ~= 'l' and outer == 'r' then
5228       item.char = characters[item.char] and
5229           characters[item.char].m or item.char
5230   elseif (dir or new_dir) and last_lr ~= item then
5231       local mir = outer .. strong_lr .. (dir or outer)
5232       if mir == 'rrr' or mir == 'lrr' or mir == 'rrl' or mir == 'rlr' then
5233           for ch in node.traverse(node.next(last_lr)) do
5234               if ch == item then break end

```

```

5235         if ch.id == node.id'glyph' and characters[ch.char] then
5236             ch.char = characters[ch.char].m or ch.char
5237         end
5238     end
5239 end
5240 end

```

Save some values for the next iteration. If the current node is 'dir', open a new sequence. Since dir could be changed, strong is set with its real value (dir_real).

```

5241     if dir == 'l' or dir == 'r' then
5242         last_lr = item
5243         strong = dir_real          -- Don't search back - best save now
5244         strong_lr = (strong == 'l') and 'l' or 'r'
5245     elseif new_dir then
5246         last_lr = nil
5247     end
5248 end

```

Mirror the last chars if they are no directed. And make sure any open block is closed, too.

```

5249     if last_lr and outer == 'r' then
5250         for ch in node.traverse_id(node.id'glyph', node.next(last_lr)) do
5251             if characters[ch.char] then
5252                 ch.char = characters[ch.char].m or ch.char
5253             end
5254         end
5255     end
5256     if first_n then
5257         dir_mark(head, first_n, last_n, outer)
5258     end
5259     if first_d then
5260         dir_mark(head, first_d, last_d, outer)
5261     end

```

In boxes, the dir node could be added before the original head, so the actual head is the previous node.

```

5262     return node.prev(head) or head
5263 end
5264 </basic-r>

```

And here the Lua code for bidi=basic:

14 Data for CJK

It is a boring file and it is not shown here (see the generated file), but here is a sample:

```

[0x0021]={c='ex'},
[0x0024]={c='pr'},
[0x0025]={c='po'},
[0x0028]={c='op'},
[0x0029]={c='cp'},
[0x002B]={c='pr'},

```

For the meaning of these codes, see the Unicode standard.

15 The ‘nil’ language

This ‘language’ does nothing, except setting the hyphenation patterns to nohyphenation. For this language currently no special definitions are needed or available.

The macro `\LdfInit` takes care of preventing that this file is loaded more than once, checking the category code of the `@` sign, etc.

```

5644  $\langle$ *nil $\rangle$ 
5645 \ProvidesLanguage{nil}[\mathbb{<<date>>}]<math>\langle\langle version\rangle\rangle</math> Nil language]
5646 \LdfInit{nil}{datenil}

```

When this file is read as an option, i.e. by the `\usepackage` command, `nil` could be an ‘unknown’ language in which case we have to make it known.

```

5647 \ifx\l@nil\undefined
5648   \newlanguage\l@nil
5649   \namedef{bbl@hyphendata@the\l@nil}{\{}}% Remove warning
5650   \let\bbl@elt\relax
5651   \edef\bbl@languages{% Add it to the list of languages
5652     \bbl@languages\bbl@elt{nil}{the\l@nil}{\{}}
5653 \fi

```

This macro is used to store the values of the hyphenation parameters `\lefthyphenmin` and `\righthyphenmin`.

```

5654 \providehyphenmins{\CurrentOption}{\m@ne\m@ne}

```

The next step consists of defining commands to switch to (and from) the ‘nil’ language.

```

\captionnil
\datenil
5655 \let\captionnil\@empty
5656 \let\datenil\@empty

```

The macro `\ldf@finish` takes care of looking for a configuration file, setting the main language to be switched on at `\begin{document}` and resetting the category code of `@` to its original value.

```

5657 \ldf@finish{nil}
5658  $\langle$ /nil $\rangle$ 

```

16.2 Emulating some L^AT_EX features

The following code duplicates or emulates parts of L^AT_EX 2_ε that are needed for babel.

```
5678 <<(*Emulate LaTeX)>> ≡
5679 % == Code for plain ==

5830 \bbl@tempa

```

\LaTeX has a macro to check whether a certain package was loaded with specific options. The command has two extra arguments which are code to be executed in either the true or false case. This is used to detect whether the document needs one of the accents to be activated (activegrave and activeacute). For plain \TeX we assume that the user wants them to be active by default. Therefore the only thing we do is execute the third argument (the code for the true case).

```

5831 \def\ifpackagewith#1#2#3#4{#3}

```

The \LaTeX macro `\ifl@aded` checks whether a file was loaded. This functionality is not needed for plain \TeX but we need the macro to be defined as a no-op.

```

5832 \def\ifl@aded#1#2#3#4{}

```

For the following code we need to make sure that the commands `\newcommand` and `\providecommand` exist with some sensible definition. They are not fully equivalent to their $\LaTeX 2_{\epsilon}$ versions; just enough to make things work in plain \TeX environments.

```

5833 \ifx\@tempcnta\@undefined

```

Currently we only use the \LaTeX 2_ϵ method for accents for those that are known to be made active in *some* language definition file.

```

6009 \DeclareTextAccent{"}{OT1}{127}
6010 \DeclareTextAccent{'}{OT1}{19}
6011 \DeclareTextAccent{^}{OT1}{94}
6012 \DeclareTextAccent`}{OT1}{18}
6013 \DeclareTextAccent{~}{OT1}{126}

```

The following control sequences are used in `babel.def` but are not defined for `PLAIN TEX`.

```

6014 \DeclareTextSymbol{\textquotedblleft}{OT1}{92}
6015 \DeclareTextSymbol{\textquotedblright}{OT1}{`\"}
6016 \DeclareTextSymbol{\textquoteleft}{OT1}{`\'}
6017 \DeclareTextSymbol{\textquoteright}{OT1}{`\' }
6018 \DeclareTextSymbol{\i}{OT1}{16}
6019 \DeclareTextSymbol{\ss}{OT1}{25}

```

For a couple of languages we need the \LaTeX -control sequence `\scriptsize` to be available. Because plain $\text{T}_\text{E}\text{X}$ doesn't have such a sophisticated font mechanism as \LaTeX has, we just \let it to `\sevenrm`.

```

6020 \ifx\scriptsize\@undefined
6021 %   \let\scriptsize\sevenrm
6022 \fi
6023 % End of code for plain
6024 <</Emulate LaTeX>>

```

A proxy file:

```

6025 <*plain>
6026 \input babel.def
6027 </plain>

```

17 Acknowledgements

I would like to thank all who volunteered as β -testers for their time. Michel Goossens supplied contributions for most of the other languages. Nico Poppelier helped polish the text of the documentation and supplied parts of the macros for the Dutch language. Paul Wackers and Werenfried Spit helped find and repair bugs. During the further development of the babel system I received much help from Bernd Raichle, for which I am grateful.
